North Roxby (EL 2932) – Acropolis South (EL 2931) Olympic Dam Sub-Domain

1st Annual and Partial Relinquishment Report For the Period Ending 25/04/03

1st July 2003

P.W. Reid & J.R. Hart

Summary

- The North Roxby-Acropolis South Project comprises two tenements in the Olympic Dam Sub-Domain. Limited historical drilling by WMC confirms its status as a first class IOCG terrain.
- A regional gravity survey has identified three high priority drill ready targets (Acropolis West, Wirrda Well South and Bopeechee West) and numerous lower priority targets.
- The Acropolis West gravity target is a direct continuation of the Acropolis trend but without a coincident magnetic anomaly. The anomaly is similar in magnitude and wavelength to Acropolis, and hence, has a comparable modelled depth of 480m.
- Wirrda Well South is a 5 mgal gravity anomaly located on a major ENE trending demagnetised structure. This fault parallels the Jubilee Fault, which hosts Olympic Dam. Modelled depth to top of basement is 800m.
- Bopeechee West is a 4 mgal gravity anomaly located at a major structural intersection, in close proximity to previously recorded IOCG – style alteration with copper-bearing hydrothermal fluids.
- At the end of the reporting period Minotaur reduced EL 2931 by 41% to 1055km² and EL 2932 by 20% to 1063km². The relinquished areas correspond to regions where no significant gravity anomalies were identified.

APPENDIX 1 Haines Surveys Gravity Data

1.0 INTRODUCTION

The North Roxby-Acropolis South Project comprises two tenements initially totalling 3111 km² in the Olympic Dam Sub-Domain. This area was originally held by WMC for a period of 16 years to 1986 before an indenture required they reduce their holdings around Olympic Dam to 3000 km². WMC drilled 4 holes into basement with results confirming its status as a first class IOCG terrain. Depth of cover (ave 750-1100m) has restricted follow up drilling or drill testing of several other significant targets. No further drilling has occurred since then despite the ground remaining tightly held by successive explorers.

Historical gravity work undertaken in the region focused on following up the principal magnetic complexes (Fig 1) in the region, with target selection weighted toward the drill testing of combined magnetic and gravity anomalies. Re-evaluation of the open file geophysical data highlighted several regional single “point gravity” anomalies (Fig 2) adjacent to or overlapping the magnetic complexes yet to be followed up.

Minotaur Resources was granted the tenements in April 2002. In July 2002 Minotaur contracted Haines Surveys to infill key areas with 1km X 1km spaced gravity coverage. Lines of 250m-spaced gravity were taken over selected targets. In total 652 gravity stations were collected.

Three targets have been identified and geophysically modelled; Acropolis West (target depth 480m), Wirrda Well South (t.d. 800m) and Bopeechee West (t.d 700m). During the second half of the reporting period joint venture negotiations were initiated between BHP Billiton and Cogema.

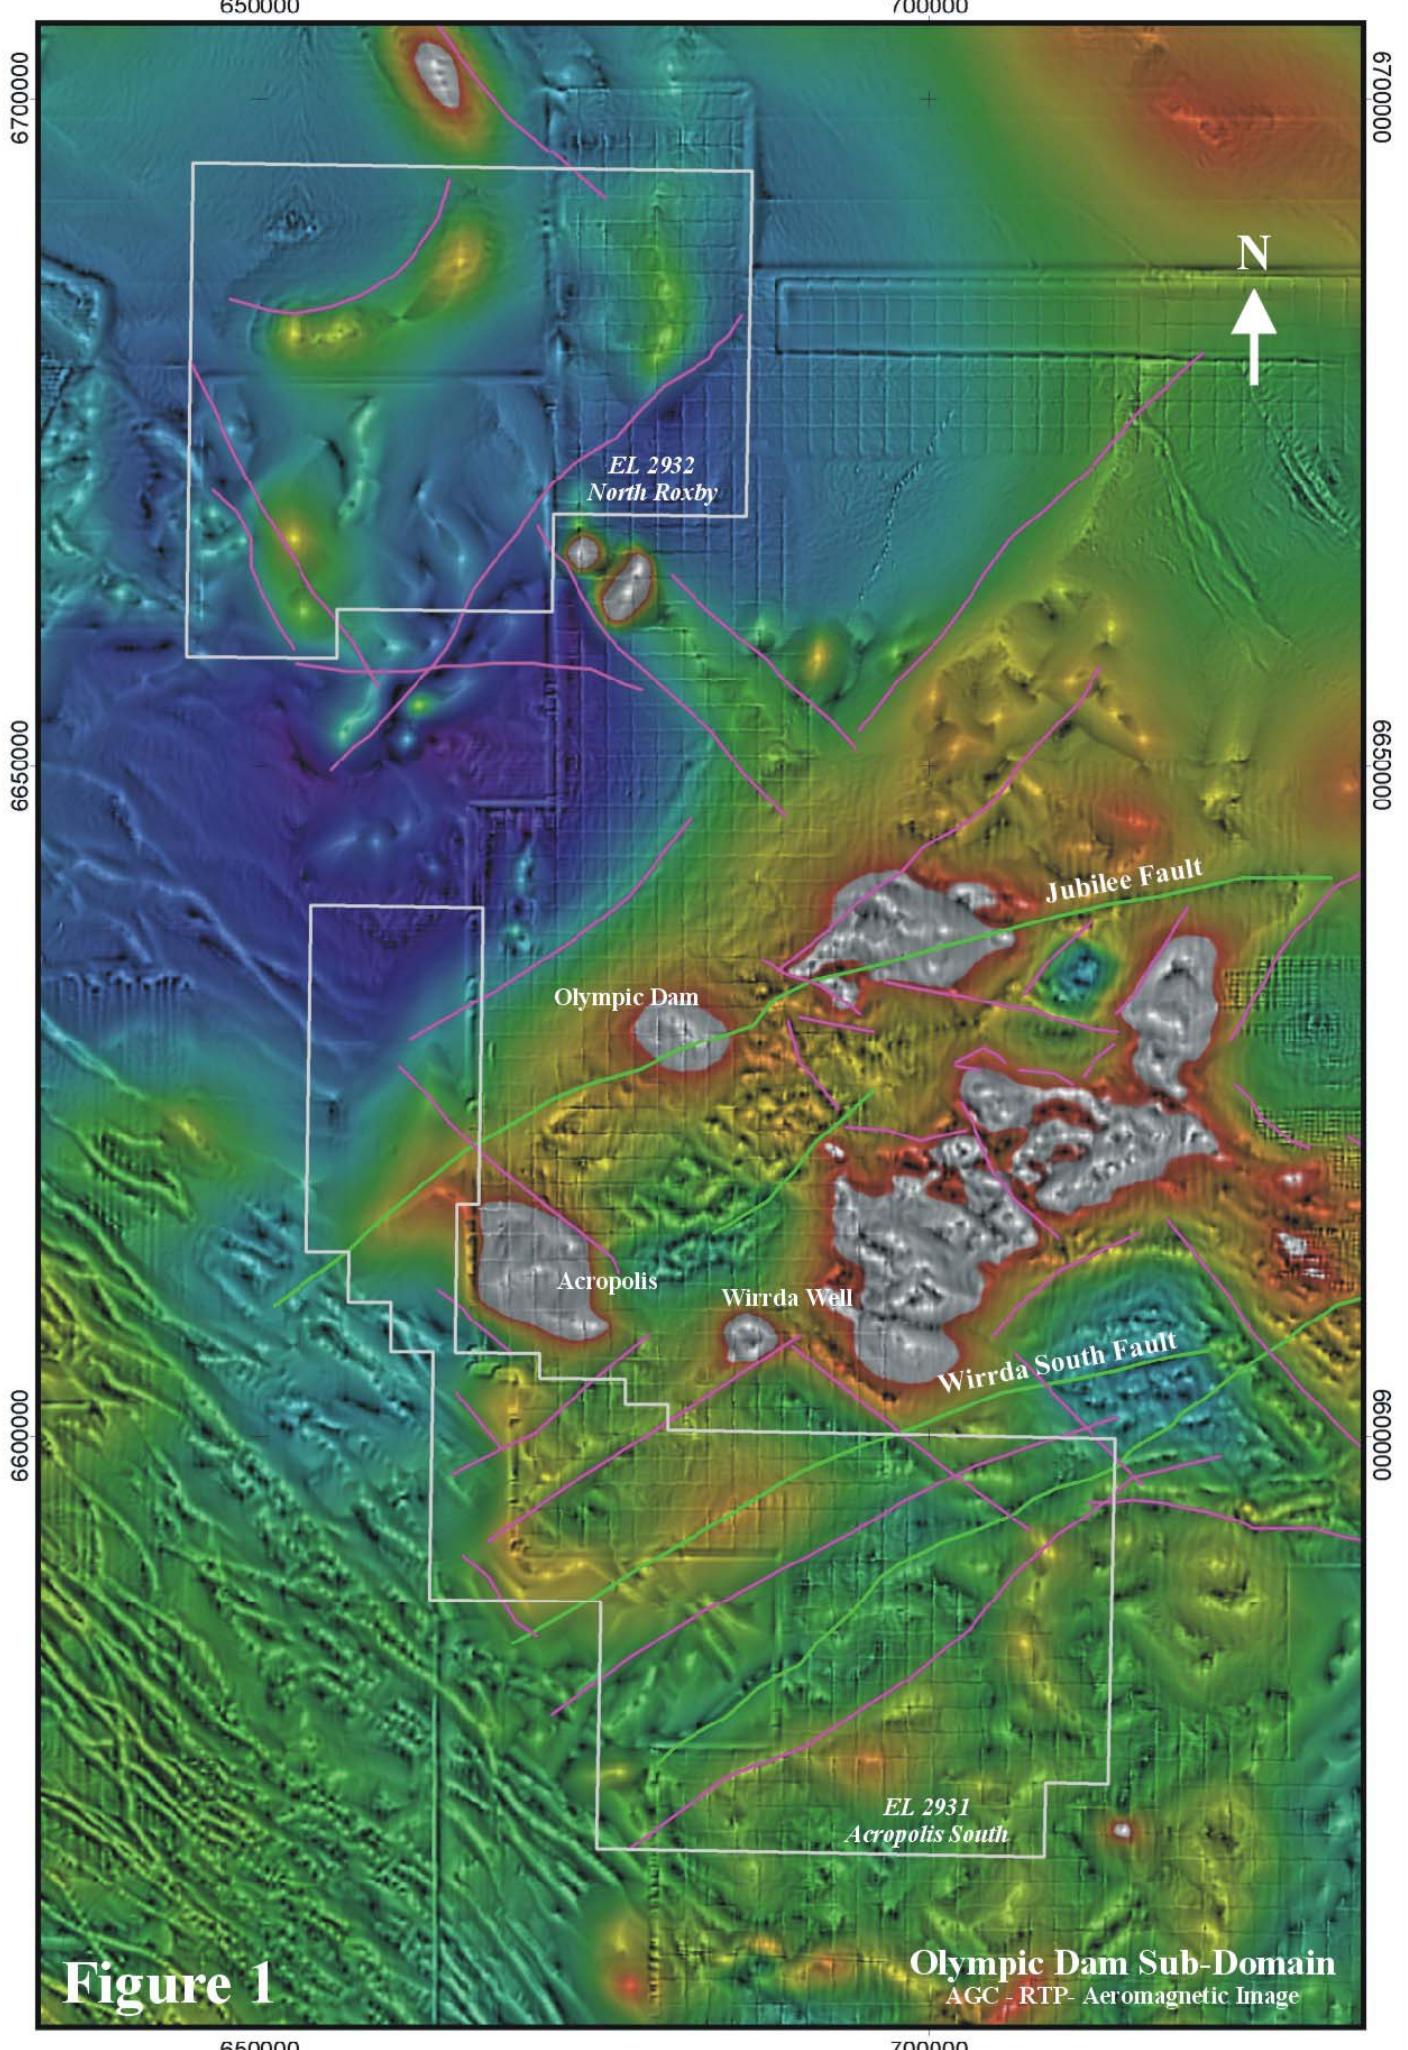

The gravity work undertaken in the first twelve months allowed Minotaur to significantly reduce its lease holdings. EL 2931 has been reduced by 41% to 1055km² and EL 2932 has been reduced by 20% to 1063km². The relinquished areas correspond to regions where no significant gravity anomalies were identified.

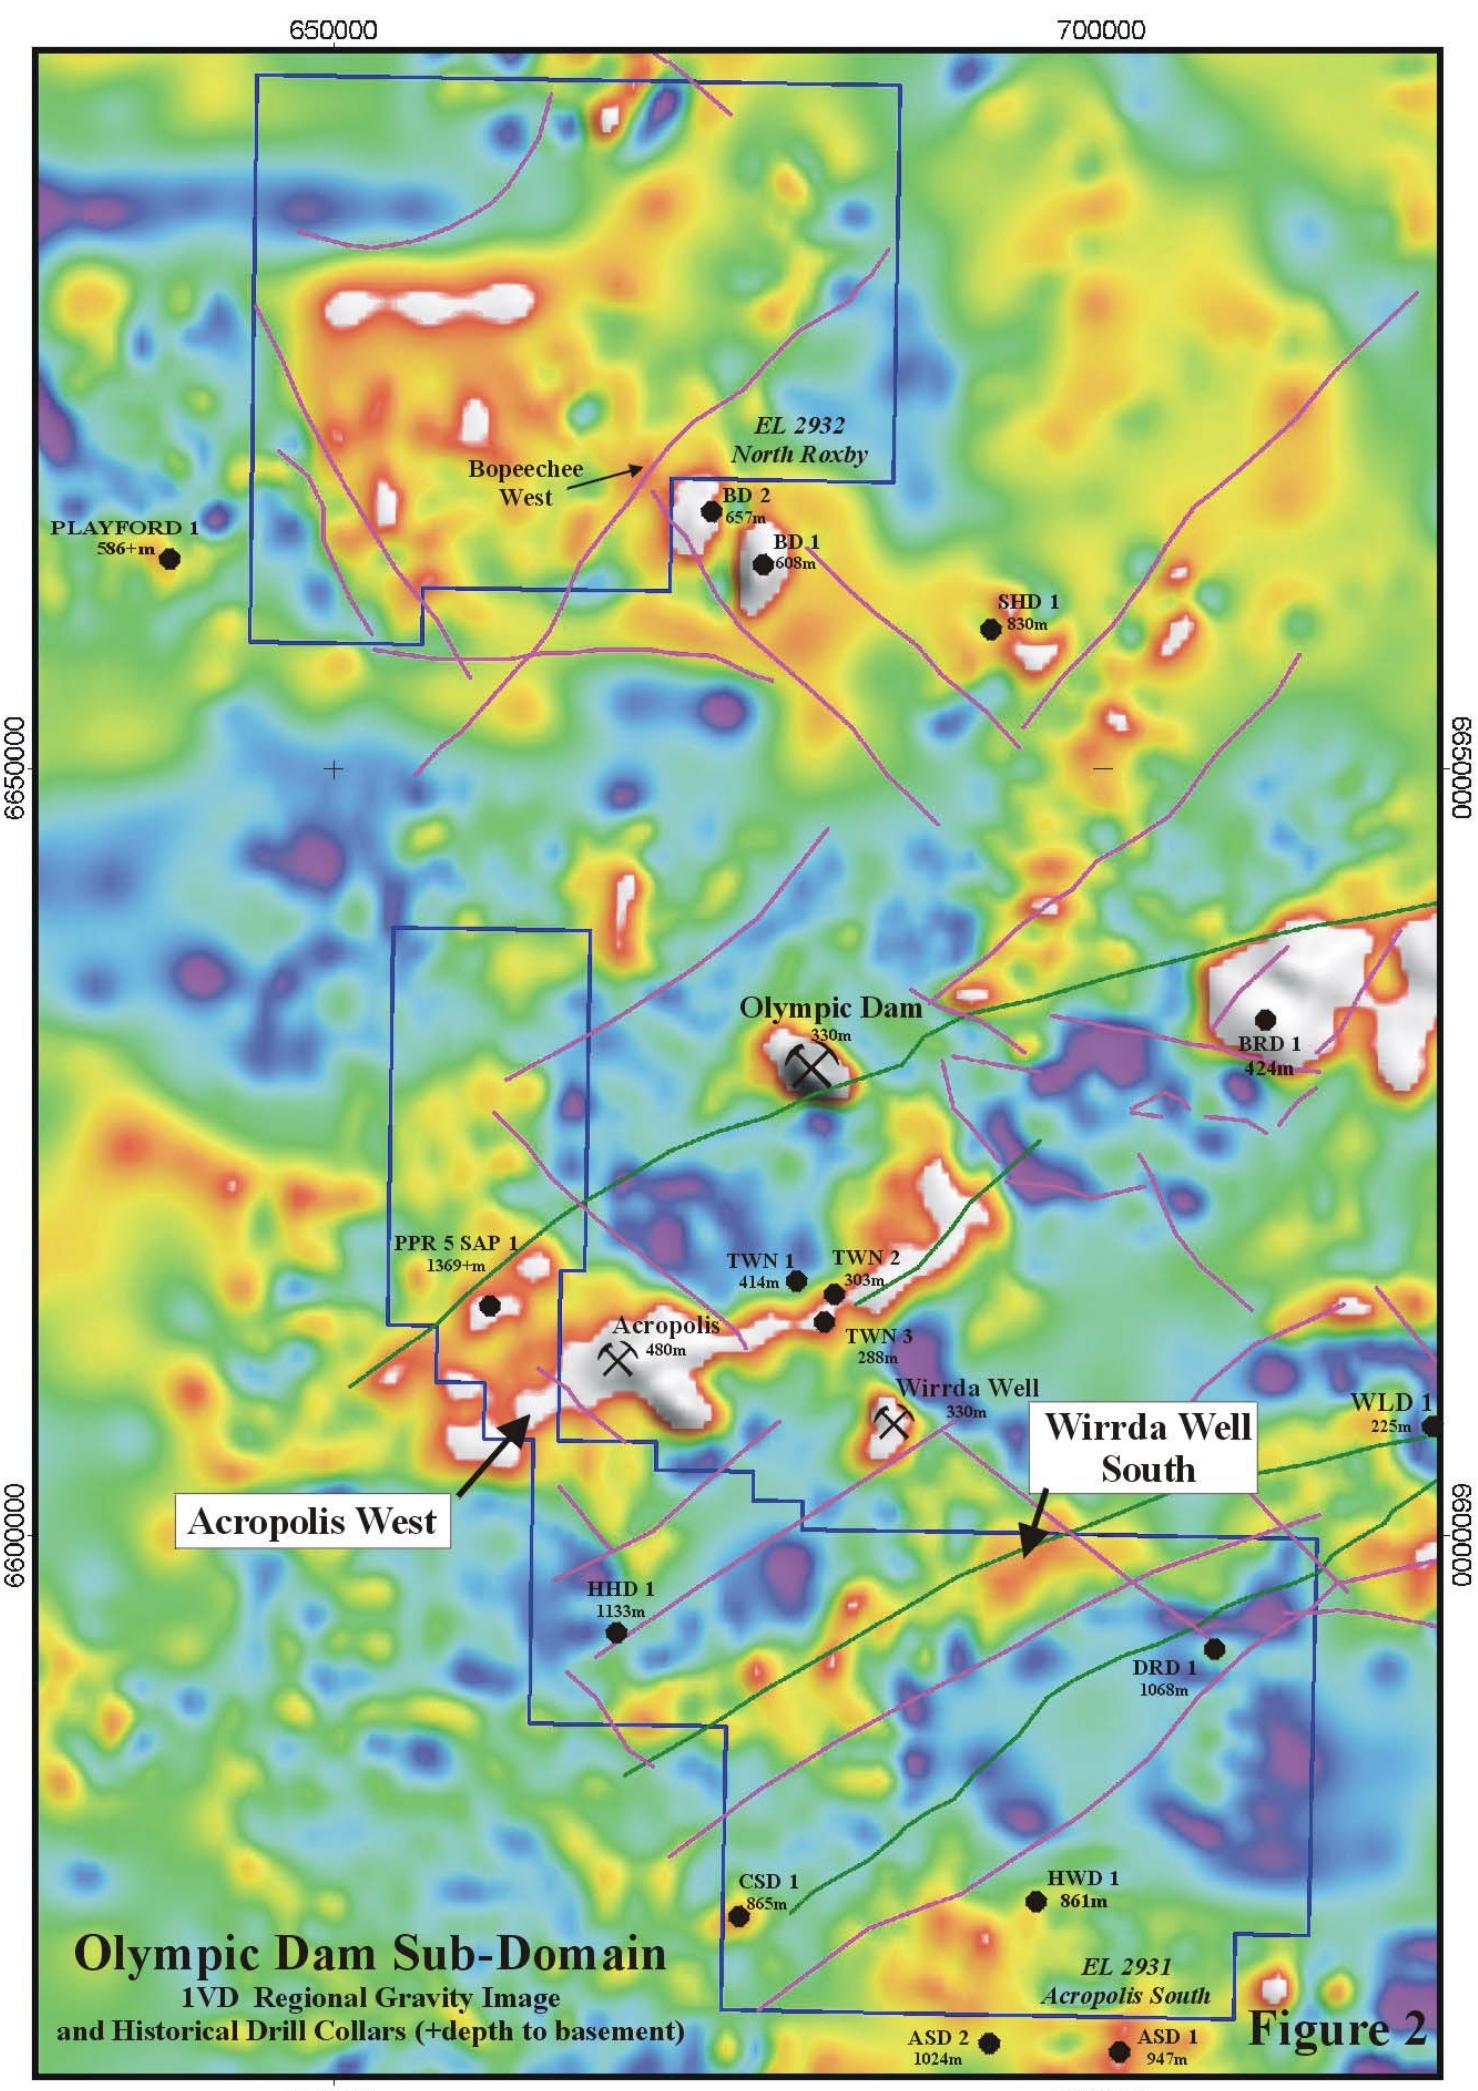

2.0 PREVIOUS DRILLING

Cocky Swamp Anomaly

An E-W trending magnetic high with a low-amplitude gravity high offset about 500m to the south (Fig 1-2). Ground surveys indicate a magnetic anomaly of less than 500 nT amplitude and a local gravity high of 1-2 mgals. These are significant anomalies when considering 800m+ of cover.

Drill Hole CSD-1 was sited at the peak of the gravity anomaly and close to the source of the N dipping magnetic anomaly. The hole intersected magnetic calcsilicate skarn rocks and metasediment at 865m. Sediments/Volcanics in CSD1 have been altered to an assemblage, which includes andradite, magnetite, amphibole, chlorite, quartz, haematite and carbonate. Up to 1.05% Cu as chalcocite-bornite and 0.65 ppm Au was returned from 1metre samples.

Dromedary Dam

A regional north-south trending curvi-linear magnetic anomaly 14 km in length with two principal magnetic peaks. A broad low-amplitude gravity anomaly (1mgal) lies to the west of the southern magnetic anomaly.

Drill hole DRD1 (Fig 1-2) was sited to test the source of the northern magnetic anomaly. The hole intersected granitic basement at 1068m (final depth 1192m). Basement consists of a microgranite to granite sequence with veins of haematite-magnetite and pyrite-chalcopyrite. Significant assays were obtained for the interval 1140m – 1146m as set out below:

| | Cu % | Ag ppm | Au ppm | Zn ppm | Pb ppm | L appm | Ce ppm |
|------|------|--------|--------|--------|--------|--------|--------|
| 6m @ | 0.38 | 14.6 | 0.8 | 2125 | 755 | 530 | 712 |

Heaton Hill

A large L shaped magnetic feature 15km in length with no pronounced gravity anomalous. Drill hole HHD1 (Fig1-2) was sited to test the source of the peak of the N-S trending magnetic anomaly. The hole confirmed estimates of deep basement (1133m) and intersected barren, non-magnetic gneissic granite.

Horse Well

The Horse Well Prospect is centred on a regionally prominent ENE trending magnetic anomaly over 12km of strike. No residual gravity anomaly occurs over the magnetic feature, however a large NE trending, gravity high (20km long) abuts the southern margin of the magnetic complex.

Drill hole HWD-1 (Fig 1-2) was targeted on the source of the main magnetic anomaly and intersect basement at 861m. The uppermost 36m of basement in HWD 1 comprised a mixture of mono- and poly-breccias and cherty volcanics with the breccias containing clasts of black haematite and volcanics in a sericite-quartz-brown hematite matrix. Below this, massive felsic volcanics, with zones of brecciation are strongly veined by platy hematite with associated chalcocite, bornite, chalcopyrite and pyrite. The volcanics continue to end of the hole at 1097m and are not sufficiently magnetic to explain the magnetic anomaly.

A 16m interval of mineralisation was intersected averaging 0.67% Cu from 903m. No other assay elements assayed returned above background values.

Bopeechee

Quasi-coincident magnetic and gravity anomalies were investigated by drill holes BD 1 and BD 2 (Fig 1-2). BD 1 was drilled on the southern end of the southern magnetic high and intersected moderately to intensely altered arkoses (cataclastic volcanics?) that are strongly

magnetic and have a S.G. of about 3.0. The dominant alteration phases in BD 1 are magnetite, chlorite and quartz with carbonate, apatite pyrite and chalcopyrite as minor phases. The basement is weakly mineralised throughout returning 333m @ 0.1% Cu (0.05 – 0.5% range) and is anomalous in Fe, REE, Co and Ba.

New magnetic and gravity data by Tasman Resources reportedly indicates BD1 tested the peak of the magnetic anomaly, with the gravity peak located some 500m to the east. Fluid inclusion studies by Geoscience Australia on BD1 samples indicate a strong copper-bearing hydrothermal fluid association.

BD 2 was designed to test the centre of the northwestern gravity high, which is offset from the centre of the magnetic high. Remodelling of this anomaly by Minotaur suggests the hole failed to test the peak of the gravity. The hole intersected a sequence of amphibolites, mafic volcanics and chloritised metasediments with no significant mineralisation.

3.0 GEOPHYSICAL MODELLING – TARGET SELECTION

The recently collected gravity data was integrated with existing open file gravity data for the region (Fig 2). Reprocessing of open file aeromagnetic data was also undertaken (Fig 1). Interpretation of these data utilizing known geological controls (ie. drill hole data) has allowed controlling faults to hydrothermal IOCG mineralisation to be interpreted and has formed the basis for target selection and target ranking. Several lower priority gravity targets are highlighted in figure 2 but have not been modelled in detail.

Open File detailed gravity data is available over the Wirrda Well, Acropolis and Bopeechee Prospects. Depth to basement and intersected lithologies are available from these prospects also and so make useful comparisons with the anomalies generated by the recent survey.

Drill Targets

Acropolis West

The Acropolis West Survey covered the western extension of the Acropolis Prospect (Fig 3). The one drill hole (SAP 1) in the area failed to intersect basement at 1369m. Two linear NE-SW striking anomalies are seen in the data. The northern anomaly is located on the same demagnetised structure that intersects Olympic Dam and has a coincident aeromagnetic anomaly. This aeromagnetic anomaly was targeted by SAP-1, so the depth to target must be deeper than 1400m below surface.

The southern anomaly is a direct continuation of the Acropolis trend. Unlike the Acropolis prospect there is no coincident magnetic anomaly. Comparison of the data, (Fig 4) shows that the anomaly is similar in magnitude and wavelength to the anomaly associated with Acropolis. Depth to basement at the Acropolis prospect is as shallow as 480m.

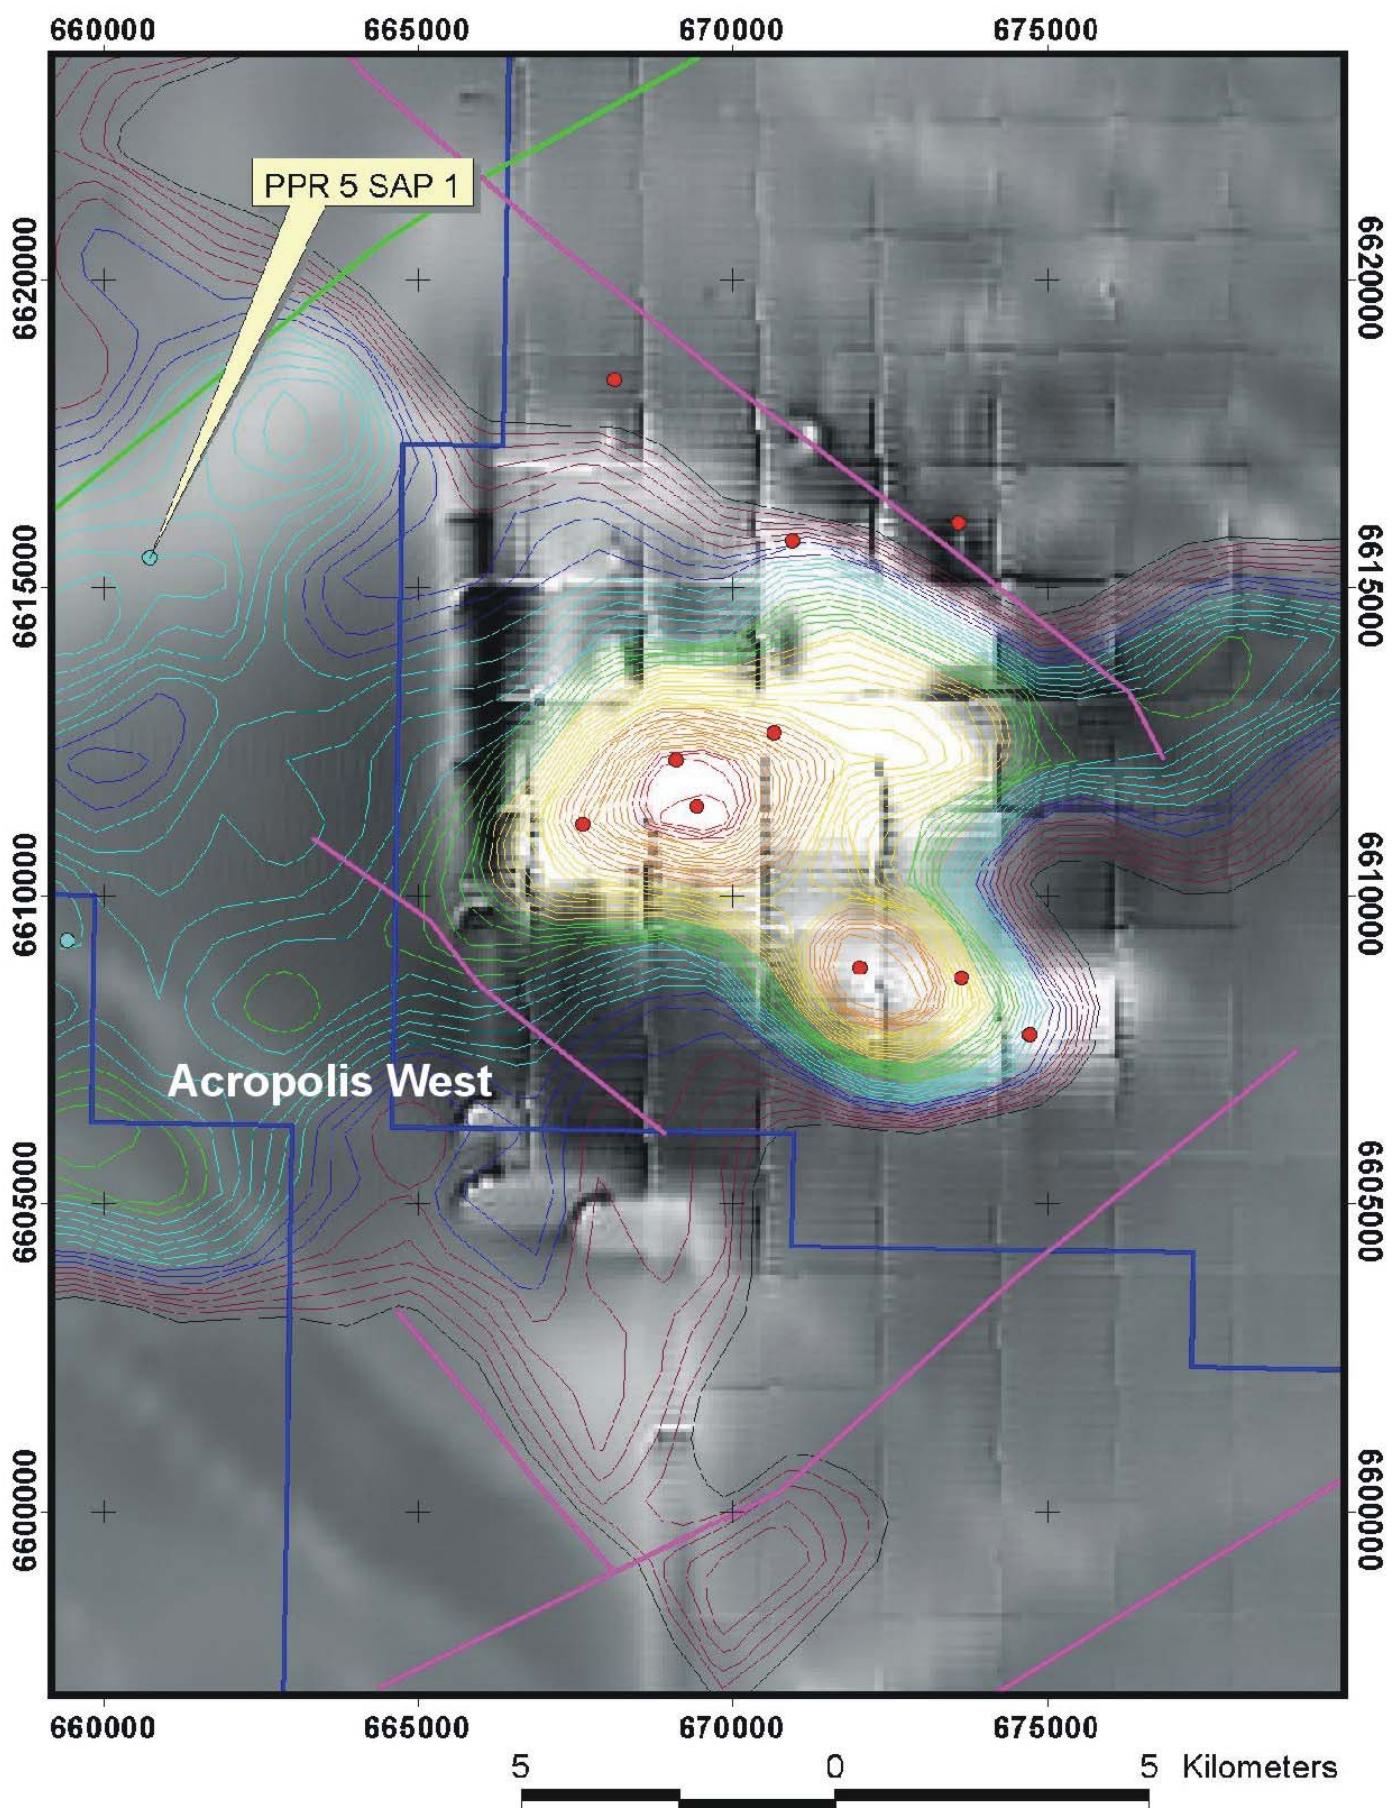

FIGURE 3. 1VD Bouger gravity contours on 1 VD aeromagnetic data over Acropolis Prospect and Acropolis West anomaly

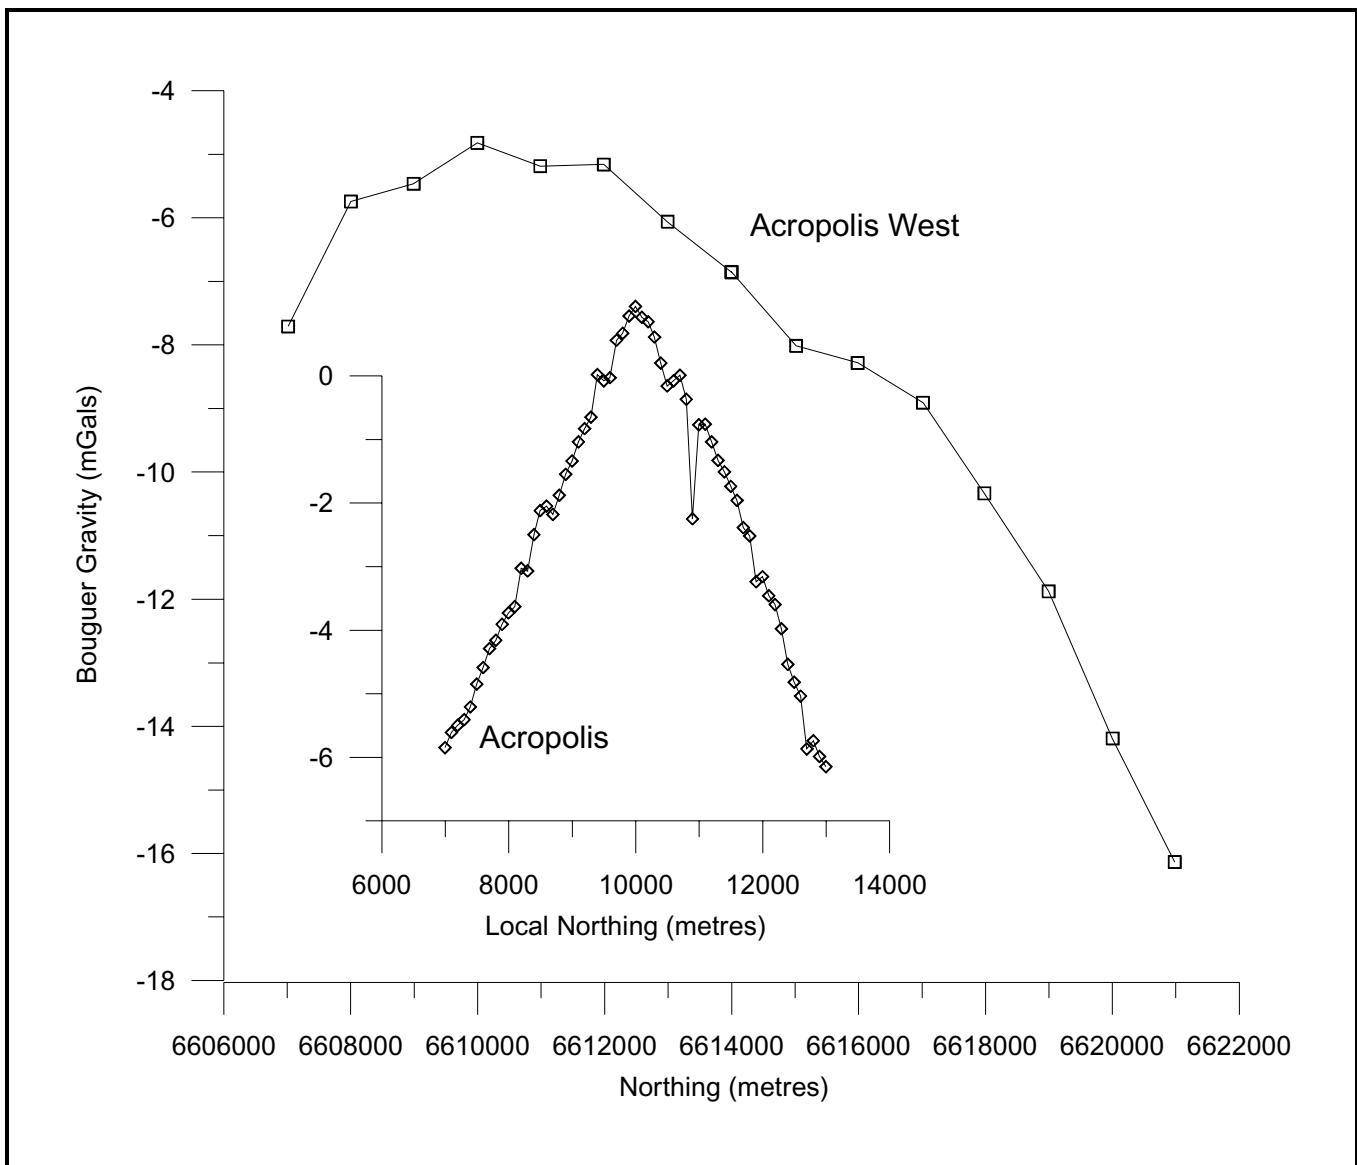

Figure 4 Bouguer Gravity Profiles over Acropolis Prospect and Acropolis West Anomaly.

Wirrda Well South

Wirrda Well South is a 5 mGal gravity anomaly located on a major NE trending demagnetised structure (Fig 1). This structure parallels the Jubilee Fault, which Olympic Dam occurs along. Recent structural and geochemical work undertaken by Geoscience Australia suggests the Jubilee Fault is the principal hydrothermal feeder conduit to the Olympic Dam mineralisation.

The anomaly has no coincident magnetic response. The anomaly has slightly longer wavelength than the Wirrda Well anomaly, though basement is interpreted to become significantly deeper beyond the southern margin of the anomaly. Modelling of this anomaly indicates a possible depth to top of basement of about 800m (Fig 5). A comparison of this anomaly with Wirrda Well is presented in figure 6.

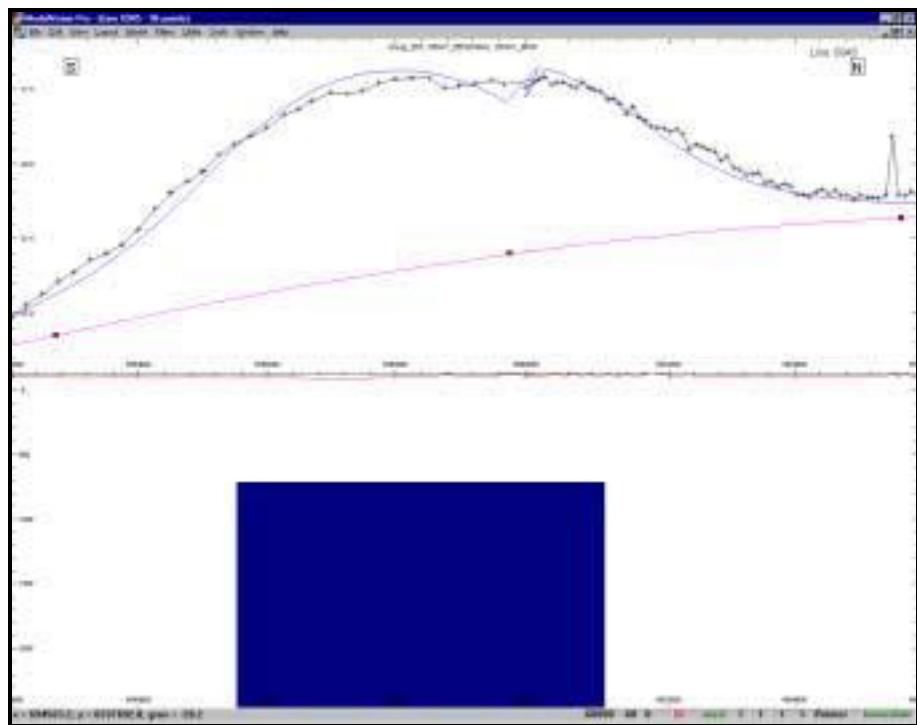

Figure 5 Modelling of Bouguer Gravity data over Wirrda Well South Anomaly

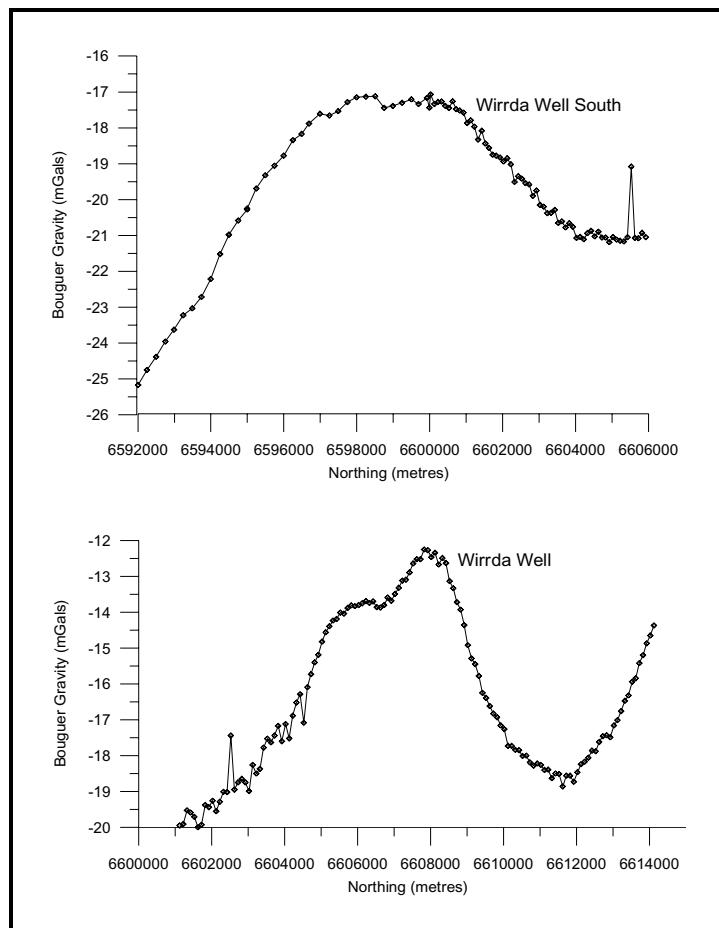

Figure 6 Bouguer Gravity Profiles over Wirrda Well Prospect and Wirrda Well Anomaly

Bopeechee West

The historical Bopeechee Prospect consists of two quasi-coincident gravity and magnetic anomalies. These anomalies were tested by drill holes, BD1 and BD2.

The gravity anomalies are 3 mGals and 6 mGals in amplitude. BD1, which purportedly tested the larger of the gravity anomalies (now believed to be located 500m away), intersected a sequence of arkoses and felsic dykes, with moderate to intense magnetite alteration. Depth to basement was 607m. BD2 failed to test either the peak of the gravity or the magnetic anomaly. It intersected a sequence of essentially non-magnetic mafic rocks including volcanics. Depth to basement was 657m.

Bopeechee West is a 4 mGal gravity anomaly that has no coincident aeromagnetic anomaly. The anomaly is similar in both amplitude and wavelength to the anomaly associated with BD2 (Fig 7). Depth to basement is most likely to be similar to the depth intersected in BD2. Modelling of the gravity anomaly is presented in figure 8. The depth to the top of the source in this model is approximately 700m. the Bopeechee West anomaly lies at the intersection of two major crustal structures and its close association with IOCG style alteration and copper-bearing hydrothermal fluids makes this a high priority for testing.

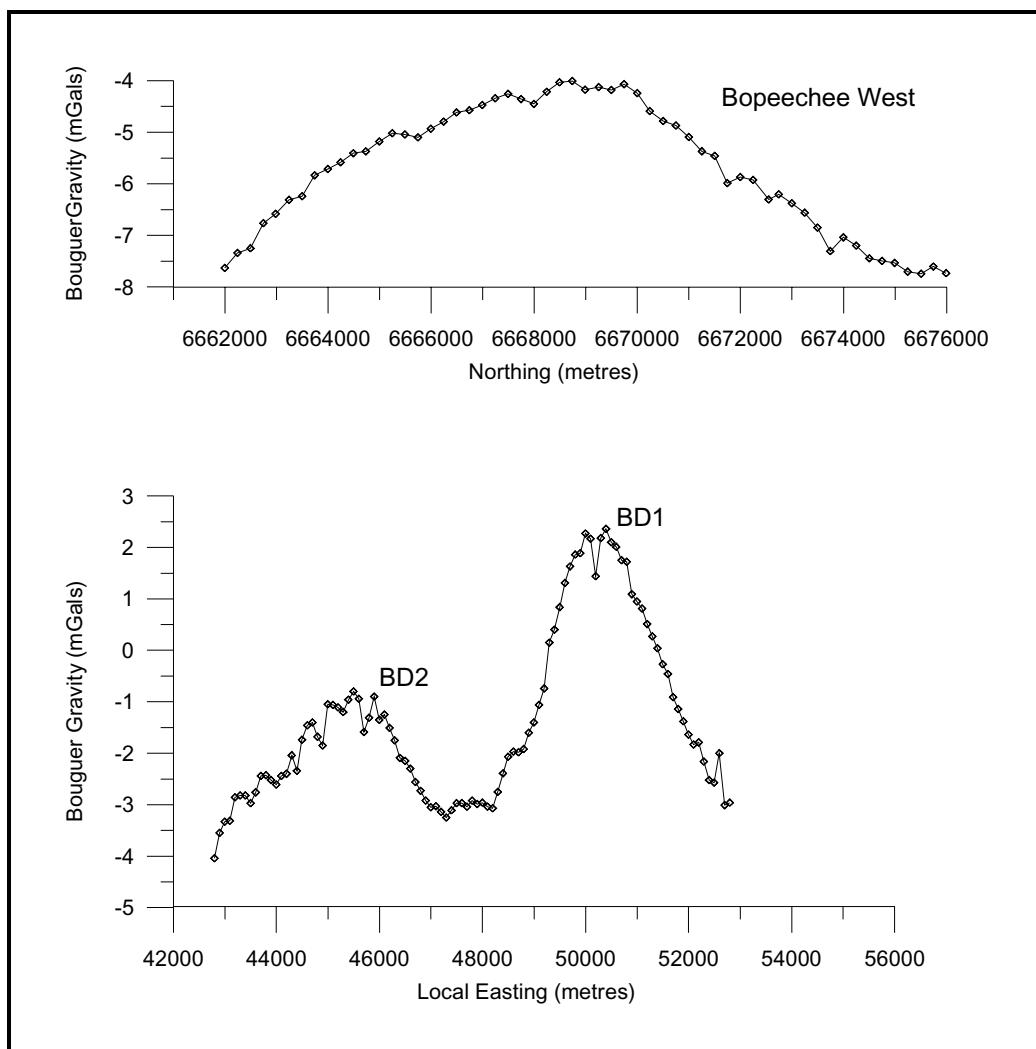

Figure 7 Bouguer Gravity Profiles over Bopeechee Prospect and Bopeechee West Anomaly.

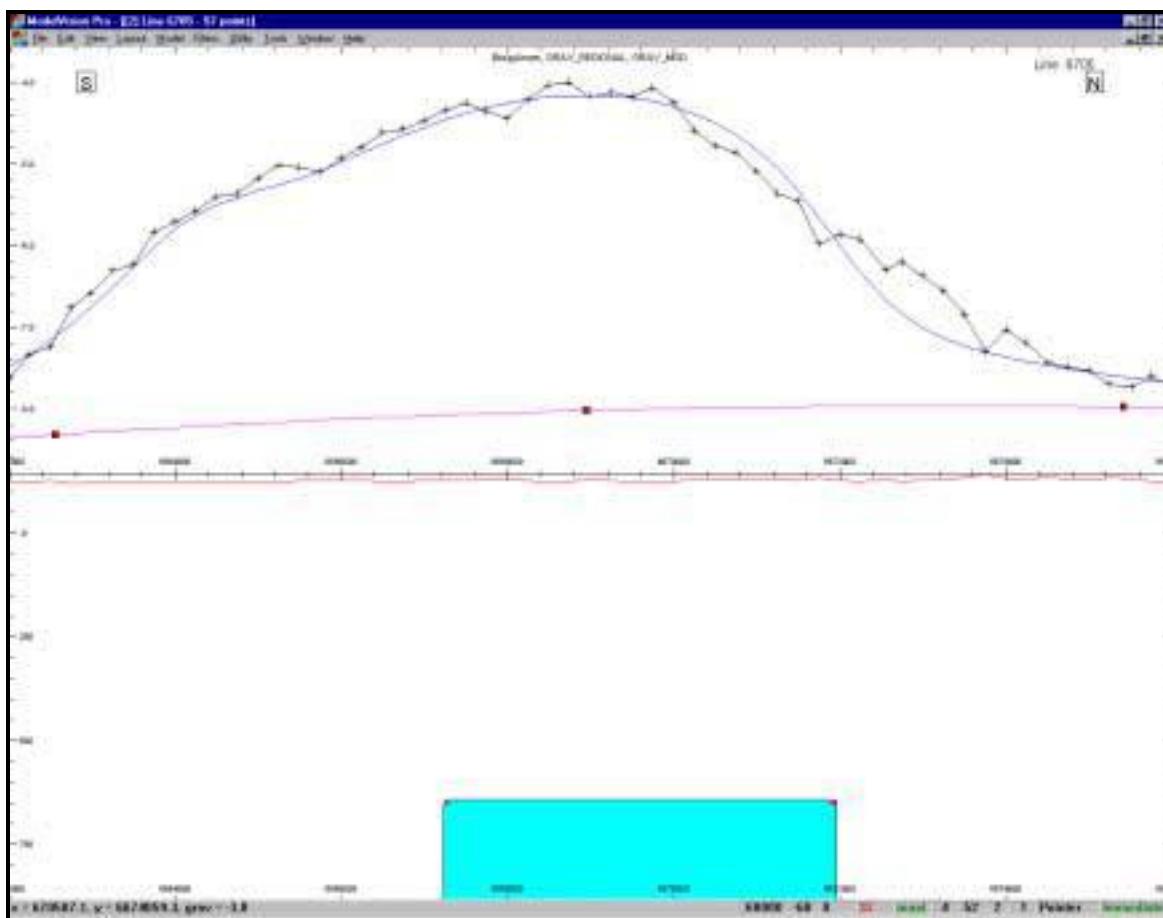

Figure 8 Modelling of Bouguer Gravity data over Bopeechee West Anomaly.

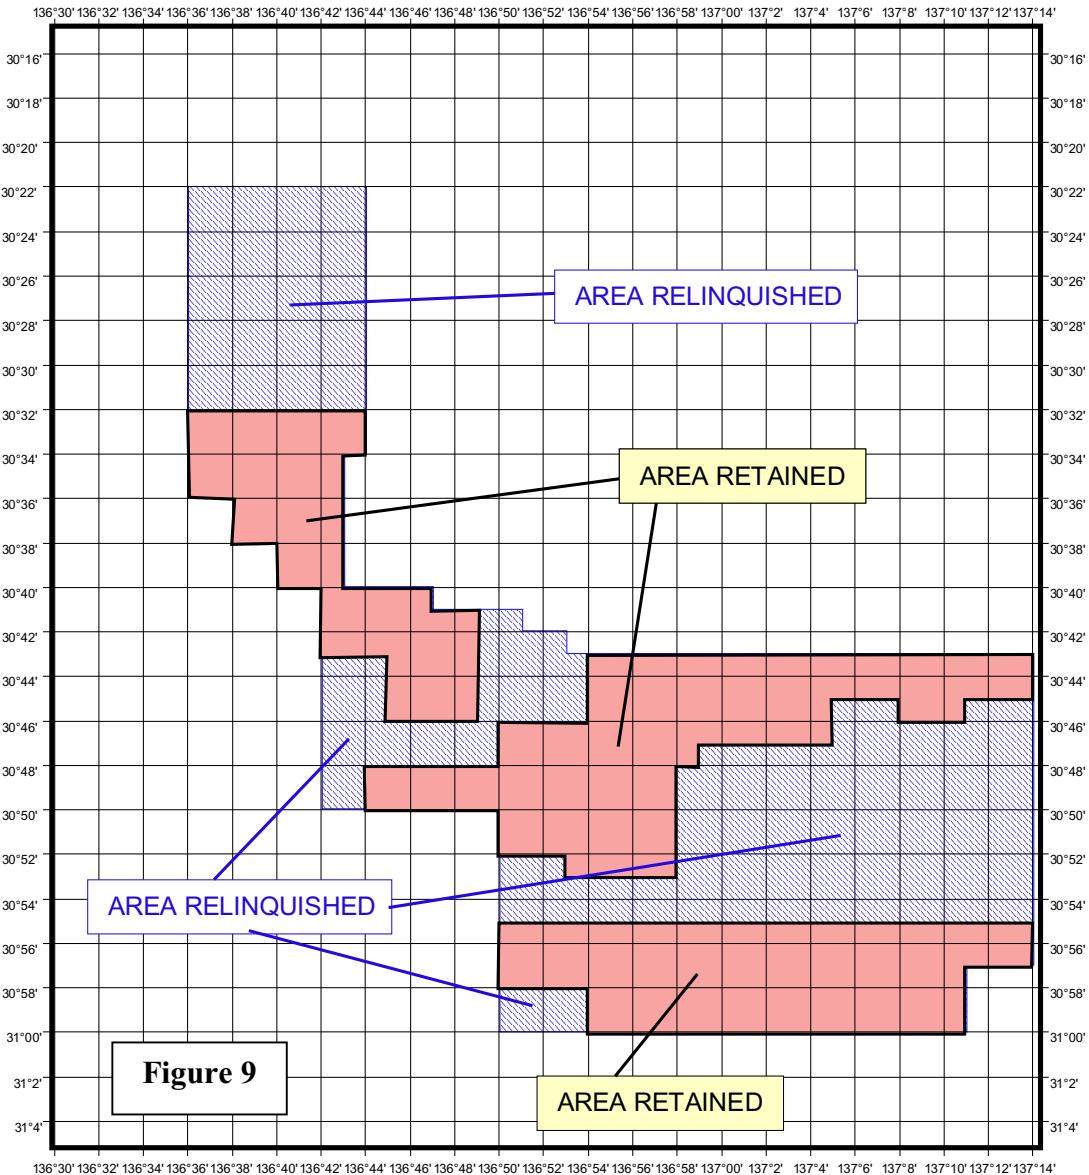

4.0 RECOMMENDED EXPLORATION PROGRAM

Acropolis West, Wirrda Well South and Bopeechee West are high priority drill ready targets. RC pre-collaring of each target to 500m with diamond tails of 100m at Acropolis West, 400m at Wirrda Well South, and 300m at Bopeechee West is a cost-effective option. Numerous other regional gravity features are present in the district, and should be critically re-evaluated based on results arising from the proposed drilling. Infill gravity and modelling is required to assess target size and depth.

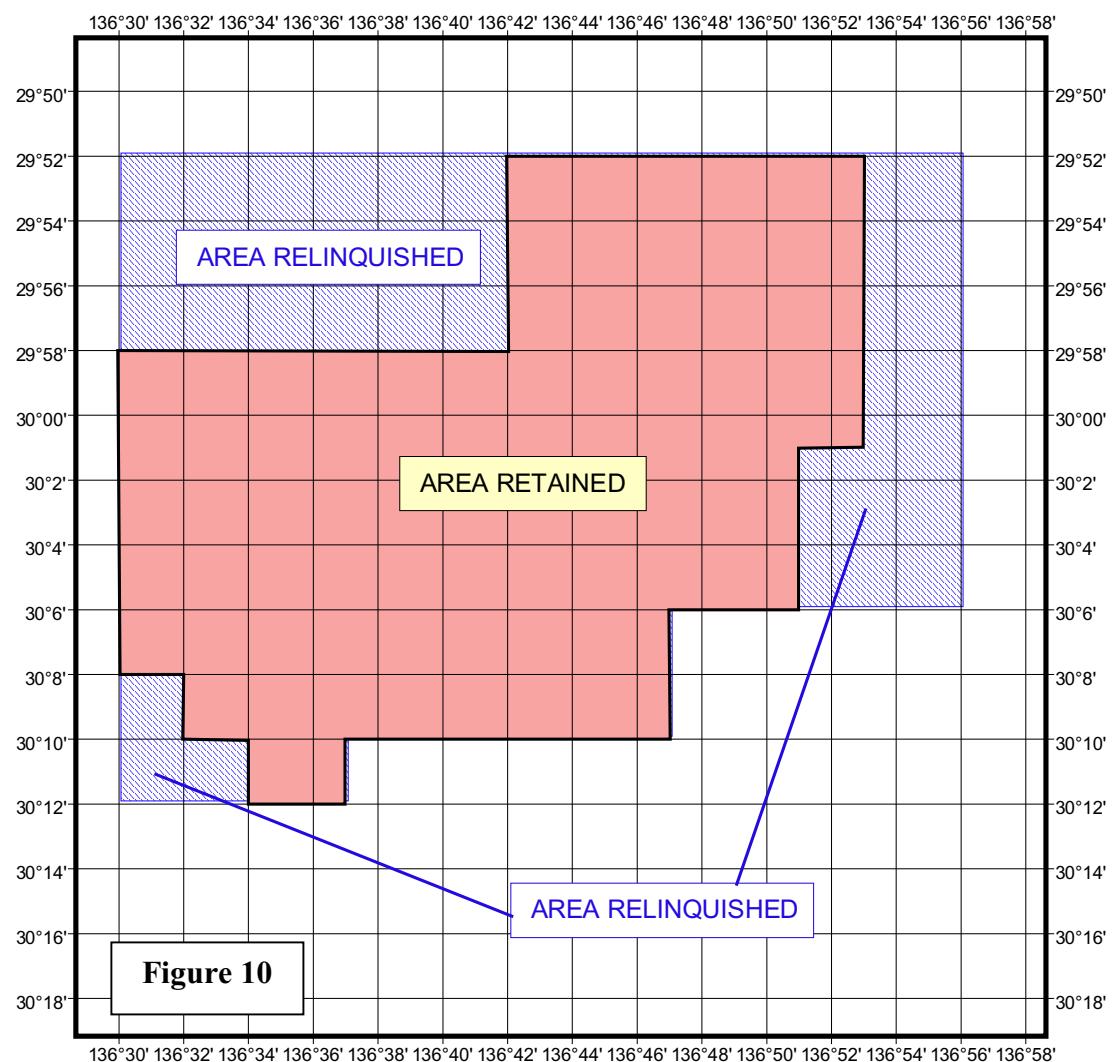

5.0 PARTIAL RELINQUISHMENT AREAS

At the end of the first reporting period Minotaur significantly reduced its lease holdings. EL 2931 has been reduced by 41% to 1055km² and EL 2932 has been reduced by 20% to 1063km². The relinquished areas correspond to regions where no significant gravity anomalies were identified. Figure 9and 10 below outline the area reductions.

EL2931 Acropolis South, areas to be relinquished

EL2932 Roxby North, areas to be relinquished

6.0 EXPENDITURE

Total Expenditure for the period amount to \$184,308. A summary of all expenditure items is presented below.

| Expenditure Item | Period Ending 25/10/2002 A\$ | Period Ending 25/4/2003 A\$ | Year Total 26/4/02-25/4/03 A\$ |
|--------------------------------|---|--|---|
| Salaries, Super & Work cover | 42,770 | 29,150 | 71,920 |
| Fees, Licence Expenses | 12,232 | -- | 12,232 |
| Computing, Maps, Data Expenses | 1,281 | -- | 1,281 |
| Field Expenses | 2,519 | 9,035 | 11,554 |

Introduction

A Regional GPS gravity survey designated as Roxby Downs 2002 Gravity Survey has been carried out in two main areas. The first survey area designed as the Northern Survey Area, it was located approximately 40 kilometres north-west of Roxby Downs in South Australia. The second survey area was located 20 kilometres south-east of the Roxby Downs and extend to 20 kilometres west of Roxby downs. The survey was conducted over 19 days from 13 July 2002 to 1 August 2002 on behalf of Minotaur Resources Ltd.

The proposed survey area consisted of a total of 5 separate survey areas. Two survey areas where located in the northern survey area and three survey areas where located in the southern survey area.

The Proposed Northern Survey Area included 233 regional gravity stations in irregular grids comprising 23 north-south running lines coincident with MGA with a line spacing of 1000 metres and station intervals of 1000 metres. During the survey an extra 89 stations where added to the survey areas in 2 north-south running lines with station spacings of 250 metres. The lines, of irregular length, were bounded in the west by MGA94 Zone 53 645000E, in the east by 676000E, in the south by 6662000N and in the north by 6676000N. The line lengths ranged from 15000 metres to 8000 metres.

The Proposed Southern Survey Area included 333 regional gravity stations in irregular grids comprising 33 north-south running lines coincident with MGA with a line spacing of 1000 metres and station intervals of 1000 metres. During the survey 84 stations where omitted. Also During the survey an extra 81 stations where added to the survey areas in 2 north-south running lines with station spacings of 250 metres. The lines, of irregular length, were bounded in the west by MGA94 Zone 53 657000E, in the east by 708000E, in the south by 6592000N and in the north by 6621000N. The line lengths ranged from 15000 metres to 6000 metres.

The completed survey comprised of the 652 stations including infill stations and not including the omitted stations. Some stations may have been slightly offset due to terrain, vegetation. There were 30 Observations repeated for quality control purposes, giving a repeat percentage of 4.60%.

The Bouguer anomaly processing has been performed using a country rock density of 2.67 g/cc. Note as requested, bouguer anomaly processing has also been carried out using country rock densities of 2.0, 2.2 and 2.4 g/cc.

Figure 1 below shows the location of the survey area.

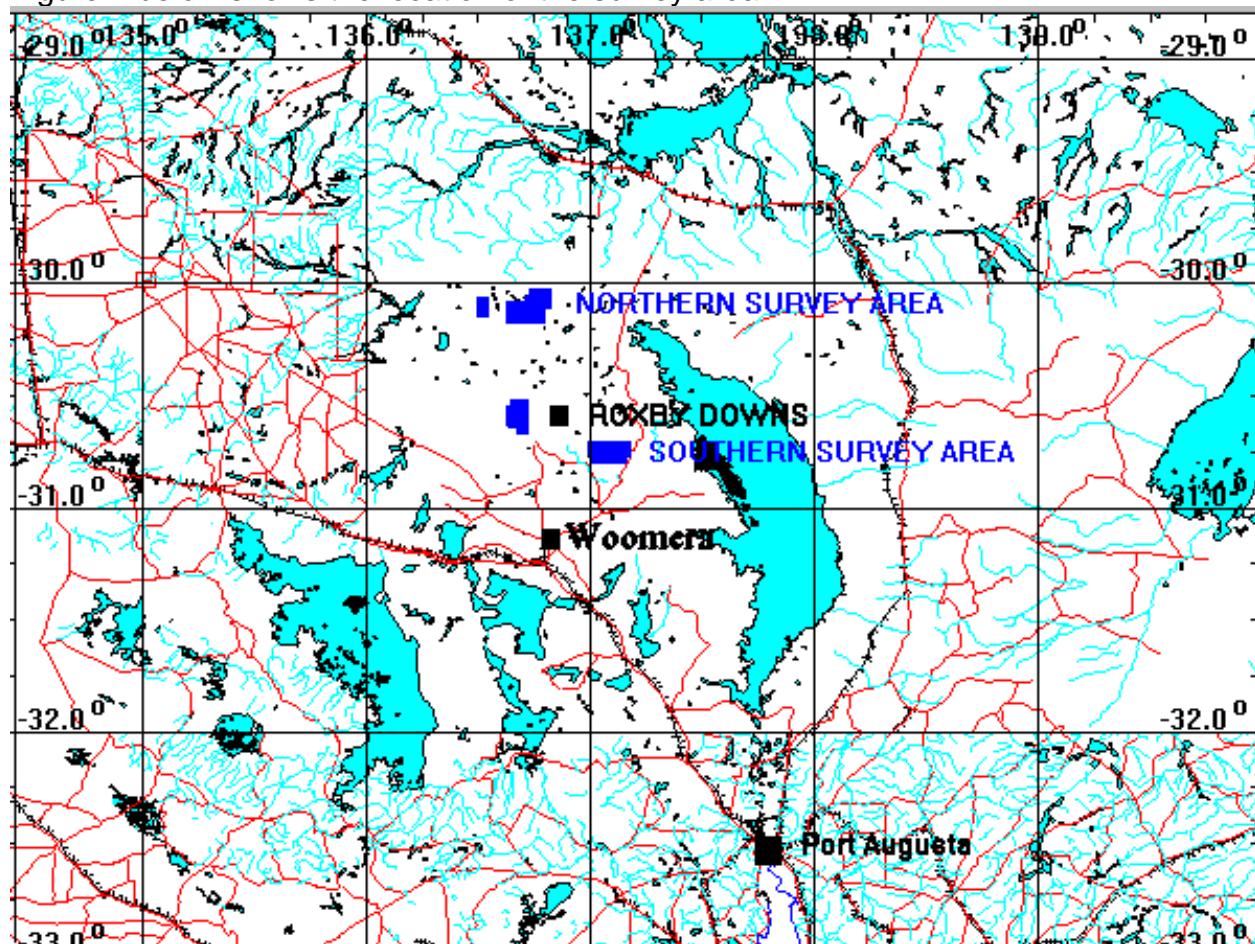

Figure 1. Location Diagram

GPS Observations and Processing

Carrier phase GPS data has been collected using *Trimble 4000* series Geodetic receivers.

Measurements for detail gravity observations have been made using Real Time Kinematic (RTK) techniques giving horizontal and vertical precisions of at least 5 cm.

Static baseline processing has been done using Trimble GPSurvey Version 2.30 software and RTK processing using Trimble TDC1 firmware and TRIMMAP Version 6.0 software.

The GPS coordinates (WGS84 datum) have been adopted from the GDA 94 values using a null transformation process. The WGS/GDA94 latitude and longitude have been converted in MGA94 zone 53 grid coordinates using TRIMMAP version 6.0 software.

The GPS ellipsoidal heights (WGS84/GDA94 datum) have been corrected to orthometric heights (AHD) using the AusGeoid98 geoid model for the control and the gravity stations.

Details of Horizontal and Vertical control are given in the sections below.

Gravity Observations

Gravity measurements have been made using *Scintrex CG3 Autograv* instruments. The instrument numbers 601307 was used in this project.

Readings of 120 seconds were taken at base station. Readings of 40 seconds were taken at all other gravity survey points.

Base station readings were taken at the beginning of the day and at the end of the day's fieldwork.

The CG3 instrument applies an instrument drift correction to its final gravity reading. Any residual drifts between base station readings are corrected by the gravity post processing software. The instrument also applies Earth Tide Correction to its final gravity reading at each station. The instrument calibration constants are contained in the daily gravity data files.

Survey Control

Local gravity/GPS bases were established in the Northern survey area, Roxby Downs and the Southern survey area and designated 0000 0001(Northern Survey), 0000 0002 (Roxby Downs), 0000 0003 and 0000 0004 (Southern Survey) respectively.

Bases 0001, 0003, 0004 are marked with a cut star picket at the natural surface with an adjacent witness post (steel star picket) with metal tag stamped "Haines Survey GPS & GRAV Base 0000 0001", "Haines Survey GPS & GRAV Base 0000 0003" and "Haines Survey GPS & GRAV Base 0000 0004". Base 0000 0002 was located on an existing Land survey Mark (unknown) there was a brass plaque located at the natural surface with an adjacent witness post (Blue Star Picket) with metal tag stamped "Haines Survey GRAV Base 0000 0002".

Horizontal and vertical control was established for bases 0001, 0003 and 0004 using the AUSPOS Online GPS Processing Service supplied by Geoscience Australia. Three separate days of data were processed by AUSPOS for each base station with a minimum of 8 hours of logged data in each file. Base 0001 had 1 sigma Cartesian coordinate precisions of 0.007m X, 0.007m Y and 0.004m Z. Base 0003 had 1 sigma Cartesian coordinate precisions of 0.005m X, 0.008m Y and 0.005m Z and Base 0004 had 1 sigma Cartesian coordinate precisions of 0.008m X, 0.008m Y and 0.004m Z

Gravity Control was established on base 0002 at Roxby downs by an ABA tie with base 1980612425 (2425) and 1980612426(2425). Gravity Control Values where supplied by Geoscience Australia formally known as AGSO. From there Gravity Control has been Established on Bases 0001, 0003 and 0004 by repeated single loop morning and evening ties.

Control information (**WGS84 heights have been derived using AusGeoid98**):

Point Numbering and Marking

An 8 digit point number is used to identify each gravity station. The first 4 digits indicate the line number. The second 4 digits indicate the station number

The lines are north-south and the 8 digits are constructed from the planned MGA coordinates for each gravity station using

$$\text{Line No} = (\text{MGA E}) / 100 \quad \text{Stn No} = (\text{MGA N} - 6000000) / 100$$

eg. Planned gravity station MGA coordinates

$$692000.000E \qquad \qquad \qquad 6592000.000N$$

$$\text{Line No} = 6920 \qquad \qquad \qquad \text{Station No} = 5920$$

$$\text{i.e. Pt No} = 69205920$$

Station numbers have been partly expanded in the processed data to show metres, that is, the Line Numbers = MGA E – 500000 and Station Numbers = MGA N – 6700000.

The gravity stations have not been marked in the field.

Gravity Processing

The gravity values for this survey are related to the *Australian Gravity Base Station Network* using the *Isogal84 (IGSN 71)* values at known Gravity Stations as provided by DMR.

Note that all gravity values shown in these surveys are expressed in units of milligals.

The field gravity observations have been processed using standard formulae and constants to produce a Bouguer Anomaly for each gravity station.

The meter reading as recorded in the raw Scintrex data file is corrected for instrument tilts, meter drift and Earth Tide. Post processing corrections are detailed below.

Drift

The residual drift between base station readings is calculated for each station reading proportionately by time. This is the drift value shown in the processing output.

$$\text{Drift} = [(t_1 - t_n) ((b_2 - b_1) / (t_2 - t_1))]$$

- t_n = time of meter reading at each station
- b_1 = base meter reading prior to station reading
- t_1 = time of base reading b_1
- b_2 = base meter reading after station reading
- t_2 = time of base reading b_2

Obs mgal

This is the observed gravity value in milligals.

$$\text{Obs} = b_g + (r_n - \text{drift}) - b_1$$

- b_g = base stn gravity value (Isogal84)
- r_n = meter reading at each station as shown in the CG3 .dat file
- drift = residual drift correction as shown above
- b_1 = base meter reading prior to station reading

Anom

This is the difference between the observed gravity and the theoretical gravity value at each station. The theoretical value is calculated using the *1967 International Gravity Formula*.

$$\text{Anom} = \text{Obs} - g_{th}$$

Obs = observed gravity as explained above

$$g_{th} = 978031.8 \left(1 + 0.0053024 \sin^2\phi - 0.0000059 \sin^2 2\phi \right)$$

ϕ = WGS84 Latitude

Freeair corrn

The freeair correction is calculated using

$$\text{Freeair corrn} = 0.3086 H$$

H = height above sea level (AHD height)

Bouguer corrn

$$\text{Bouguer corrn} = 0.04192 \rho H$$

ρ = density (2.67 g/cc used for this survey)

H = height above sea level (AHD height)

Bouguer Anom

$$\text{Bouguer Anom} = \text{Anom} + \text{Freeair corrn} + \text{Bouguer corrn}$$

Results Formats

Printed results of the gravity processing (with Bouguer corrections at density 2.67 g/cc) are included in the Appendix of this report. The results are also supplied in digital form on floppy disk with the following of files being supplied.

ALLCOR.XYZ ALLGEO.XYZ ALLCSV.CSV

Field gravity observation files with the extension .DAT and .DC and summarised GPS baseline solution files with extension .GPS are also supplied in a separate subdirectory named OBS.

ALLCOR.XYZ format

This is a *GEOSOFT* compatible XYZ (space delimited columns) file. The data is sorted by Day then Line and Stn number. The column order is as follows: Extra columns have been added for Bouguer corn and bouguer anom processed at densities of 2, 2.2 and 2.4 as requested.

| | | | | | | | | | | | |
|-------|-------|------|-----|-------|--------|------|------|---------|---------|---------|--------|

| | | | | | | | | | | | (2.67) |

ALLGEO.XYZ format

This is a *GEOSOFT* format XYZ (space delimited columns) file. The data is sorted into Line and Stn number suitable for profiling. The column order is as follows: Extra columns have been added for Bouguer corn and bouguer anom processed at densities of 2, 2.2 and 2.4 as requested.

| | | | | | | | | | | | |
|------|-----|-------|-------|-------|--------|------|------|---------|---------|---------|--------|
| Line | Stn | AMG E | AMG N | drift | corr'd | obs | anom | freeair | bouguer | bouguer | height |
| | | | | meter | | mgal | | corr'n | corr'n | anom | (AHD) |
| | | | | | | | | | | | (2.67) |

ALLCSV.CSV Format

This is a Comma Separated Variable format file. This format facilitates data import into spreadsheet and database software. Each record (line) contains the following data fields:

Pt Number, Line No, Station No, Date, Day Number, Local Time, WGS Latitude, WGS Longitude, WGS Height, AMG East, AMG North, AHD Height, Meter reading, Meter reading standard deviation, Earth Tide Correction, drift correction, corrected meter reading, gravity difference (mgal) from base, observed gravity (mgals), gravity anomaly, freeair correction, Bouguer correction (2.67), Bouguer anomaly

*.DAT

These are the raw data files from the *Scintrex CG3* gravimeter. There is a separate file for each day's data for each field party. The files are identified by the Julian day number (001 = Jan 1st) with the prefix G. eg. G142 = day 142 (21st May).

*.DC

These are the GPS Real Time Kinematic Data Collector files. They are ASCII format files containing the GPS vectors from the base station. The data is structured in a Trimble format (DC file Version 4).

*.GPS

These are the GPS solution summaries for all post processed Fast Static baselines with a separate file for each day's solutions. Each record (line) contains the following data fields:

Station, Solution Type, GPS Time, WGS84 Latitude, WGS84 Longitude, WGS84 Height, WGS84 dX, WGS84 dY, WGS84 dZ, Wgs84 dH, Baseline Distance, Solution Reference Variance, Solution RMSE, Rover Antenna Height, Baseline Standard Deviation , Solution Variance Ratio, Observation Count/Rejects, Observation Start time, Observation Finish time

Dear Mineral Registration

We would like to apply for joint reporting status for EL2931 (Acropolis South) and EL2932 (Roxby North). Each tenement has recently undergone a 25%+ partial relinquishment as part of the renewal process. ~~As a result of this, Minotaur would like to submit a combined annual and partial relinquishment report.~~ All data therefore from the first annual report is to ~~become open file~~ in order to satisfy the relinquishment reporting guidelines.

Kind Regards

Peter Reid
Minotaur Resources
