30th April, 1987

The Director-General,
Department of Mines & Energy, South Australia
P.O. Box 151,
EASTWOOD. S.A. 5063.

Dear Sir,

Re: Hope Bank E.L. 1376, S.A.

Report For Quarter Ended 5th April, 1987

No field work was undertaken.

Digital aeromagnetic data was purchased from the BMR. Data will be COMTAL imaged by CRAE's Canberra Research Group to aid geological mapping.

Expenditure for the quarter to the nearest accounting period amounted to to: $5339.00. The expenditure consisted of:

Payroll	$1770.00
General Supplies	$ 414.00
Vehicle Operation	$ 80.00
Travel	$1434.00
Property	$ 720.00
General Overheads	$ 921.00
Total	$5339.00

Yours faithfully,

W.H. JOHNSTON
CHIEF GEOLOGIST, S.A./N.T.

9th July, 1987

The Director General,
S.A. Department of Mines & Energy,
P.O. Box 151,
EASTWOOD. S.A. 5063

Dear Sir,

Re: HOPE BANK E.L. 1376

Second Quarterly Report - Period Ending 5 July, 1987

No field work was undertaken.

Digital aeromagnetic data purchased from the BMR was COMTAL imaged by CRAE Canberra Research Group.

A detailed stream geochemical sampling has been planned and is programmed to commence in mid July 1987. Concurrently a detailed stratagraphic mapping at 1:40 000 scale will be undertaken.

Expenditure for the quarter to the nearest accounting period amounted to $1,443.00, the expenditure consisted of:

Payroll	$ 892.00
General Supplies	$ 119.00
General Overheads	$ 432.00
	$1443.00

Yours faithfully,

W.H. JOHNSTON
Chief Geologist

LIST OF PLANS

Plan No.	Title	Scale
SAa 4244	Hope Bank EL 1376, S.A. - Location Plan	1:250 000
SAa 4742	Hope Bank EL 1376, S.A. - Sample Sites, Catchments and Geology - Overbank Clays	1:100 000

LIST OF TABLES

LIST OF APPENDICES

1. SUMMARY

Overbank silt samples were collected from four hundred and fifty-two catchments in the 0.5 km^2 to 5.0 km^2 size range. A nominal -10 micron fraction separated from these samples was analysed for twenty elements including gold. A further one hundred and ten soil samples east of the Waukaringa Mine and from the drainage divides of the catchment sampled by 1239595 and six rock samples from miscellaneous locations were also collected.

Mapping of the licence area showed that the Tarcowie Siltstone, the host of the Waukaringa and Ajax Mines, changed along strike from being a prominent ridge-forming unit to one of low relief favoured as drainage lines. These portions were not tested by previous licence holders, nor covered by sampling in this survey. Sampling is recommended.

Forty adjacent catchments anomalous in gold only, all drain the upper glacial sequence (Elatina Subgroup). This reinforces the indication from the regional survey that gold concentrations occur at this stratigraphic level (e.g. at the Dustholes Mine, Mt. Grainger) and are probably fluvial concentrations.

2. LOCATION

Hope Bank EL 1376 is located approximately 20 km north west of the Yunta township on the Adelaide-Broken Hill Highway (plan no. SAa 4244).

3. RECOMMENDATIONS

3.1 Interpretation

Final assays have been only recently received. Therefore only preliminary interpretations and recommendations have been made. Further, more detailed interpretation is necessary before the next phase of field work begins and final recommendations made.

3.2 Spur Soil Sampling

Marginal spurs and subdividing spurs of catchments showing sufficient anomaly to be of interest should be soil sampled at 100 m spacing. This should allow delineation of the parts of the catchments containing the source of the anomaly.

3.3 Gridding

Areas such as the upper portion of the catchment represented by sample 1239595 need to be soil sampled on a grid pattern no bigger than about 25 m x 125 m to delineate targets for backhoe costeaning and channel sampling.

3.4 Costeaning

The valley expression of the Tarcowie Siltstone upstream and downstream of Folly Dam should be exposed in at least three sections by a digger or backhoe costean (the cover is generally less than 2 m) and channel samples collected over zones of argillic alteration and other rock types of interest.

4. INTRODUCTION

Hope Bank EL 1376 was granted to CRA Exploration Pty. Limited on the 6th January, 1987 for a period of one year. The licence covers an area of approximately 1303 sq km and covers parts of East Wydown, McCoys Well, Melton, Minburra, Teetulpa & Wabricoola stations.

In the period 1981 to 1985, Utah spent in excess of, (Historical), $600,000 sampling and drilling a tenement with approximately the same boundaries in an attempt to locate a Telfer style gold resource without success (SADME Open File Report envelope No. 4547). The stream sediment geochemistry approach used in this survey was designed to test all subcrop within the licence area regardless of stratigraphy and the multi-element signature used to rate areas of anomalous gold.

5. GEOLOGY

The main rock units found within the licence are the Adelaidean sediments of the Yudnamutana, Farina & Elatina Subgroups and Wilpena Group. Thin Quaternary sands, gravels and alluvium cover much of the above stratigraphy.

Table 1 describes the Adelaidean stratigraphy in greater detail.

Locally the licence covers the eastern and western closures of the Waukaringa Syncline and a parallel antiform in the same sequence to the south. The mineralisation at Waukaringa and Ajax mines (which lie in that portion of the Waukaringa Syncline not held by CRAE) is associated

with quartz and arsenical pyrite filling dilation zones in layer-parallel fault planes. At Waukaringa Mine, material on the dumps (apparently from development work) contains superfine sulphide mineralisation in sandstones and black siltstones, suggesting that the mineralisation in the quartz lodes occurs nearby to primary mineralisation in the sediments.

Table 1

ADELAIDEAN STRATIGRAPHY - HOPE BANK EL 1376

Group	Unit	Lithology
Wilpena Gp	Pound Sst.	Quartzite feldspathic sandstone & siltstone
	Wonoka Fmn.	Calcareous siltstone & shale minor limestone & quartzites
	Ulupa siltstone	Siltstone (Brachina Equliv)
Elatina Sub Gp - Upper Glacial Gp		Diamictite & fluvials
Farina Sub Gp (intraglacials)	Undifferentiated	Shales, siltstone, carbonatic siltstones, minor carbonate units
	Tarcowie siltstone	Siltstone & sandstone
	Willochra Fmn.	Siltstone, shale, minor gritty sandstone & limestone
	Tapley Hill Fmn.	Siltstone, limestone, minor breccia bands, slump conglomerates & sandstone
Yunnamunta Sub Gp	Wilyerpa Qtzite	Sandstone, siltstone and minor tillites
	Appilla Tillite	Boulder tillite siltstone & sandstone
Callana Gp	Undifferentiated	

6. CONCEPTS

The target sought is disseminated gold mineralisation which would have been too fine in grain size to have led to discovery of the source by panning. A number of pannable gold occurrences were located in the district during the Nineteenth Century including the Teetulpa alluvial goldfield and the layer-parallel lodes of the Waukaringa and Manna Hill goldfields. The one to two metre thick regolith which mantles much of this region is considered sufficient cover to mask mineralisation not associated with quartz veins or major gossans, but not sufficient to hide a chemical signature.

The kaolinitic clays of the regolith have a small but significant cation exchange capacity. The choice of clay-size material as a sample medium for this project was forced by the dynamics of this landscape. Much runoff is as sheet flood during rainstorms and little material above sand-size is transported to the drainage lines. The quartz sand/silt component is assumed chemically inert and its removal gives a more homogeneous sample medium than is able to be obtained by sieving. The relatively normal distribution of the background populations of most base metals as they report in their frequency distribution histograms appears to support this assumption. The occurrence of multi-element signatures in some samples is considered more significant than outstanding gold values.

7. SAMPLING

Stream sediment samples were collected at sites pre-determined by plotting stereoscopically over the aerial photographs. Each site represented a primary catchment in the size range 0.5 to 5.0 km^2. Samples were collected from the overbank silts/clays of the floodplain, with care being taken that the sample was not dominated by local colluvium. Where no flood plain was developed, silts were collected from clay curls in dried pool bottoms, settling areas behind bushes in the channel or remnant overbank deposits exposed in the sediments along the creek bank. Clay size fraction material, separated from the overbank silts by suspension and decantation, was submitted for analysis.

Four hundred and fifty-two catchments were sampled in the first pass and a further 68 soil samples were collected at 100 m spacing along lines crossing the mine-host stratigraphic sequence in the axial zone of the syncline east of the Waukaringa Mine. Soil samples were processed identically to the overbank silts. Little horizon differentiation is present in these soils though well developed argillic B-horizons are occasionally seen in remnant palaeosols. The soils are mainly skeletal (A)/C soils with a large lithic component. Aeolian sand sheets mantle these in some areas and the ubiquitous drainage line calcretes which form upon both fresh and kaolinized rocks suggests that much of the soil carbonate is derived from a carbonate component brought in the sand sheets.

All samples were analysed for gold to a nominal detection limit of 0.0005 ppm (aqua regia digest/solvent extraction/FAAS) 8 other elements were determined by AAS and a further 10 by ICP. In addition the first 181 samples were assayed for platinum and palladium by lead fire assay.

One catchment with anomalous gold values (1239595) supported by a multi-element signature (which was identified from the first batch of results received) was followed up by collecting 42 soil samples at 100 m spacings up the spurs bounding the catchment from the original sample site. The source of the anomaly appears to be in the Tindelpina Shale Member and higher up in the lower part of the Tapleys Hill Formation.

8. INITIAL RESULTS

The first pass sampling over the whole exploration licence area revealed an area in which all catchments sampling the upper glacial package (mapped as Elatina Subgroup) reported elevated gold values. This stretches from east of Wabricoola Homestead to west of One Tree Hill on McCoys Well. These results are not supported by anomalies in other elements with sulphide affinities, so it is considered that this gold may be derived from fluvial concentrations in reworked zones within this unit.

In regional orientation work it was noted that an arsenic/antimony association did not follow stratigraphic units but crossed the stratigraphy on a north-northeasterly trend. During geological reconnaissance this was found to be the trend of closely spaced joint sets. North of Melton (outside the licence area) some of these joints were noted filled by a quartz/siderite/haematite after sulphide association, but usually a thin selvedge of slightly ferruginized rock rather more resistant to weathering (presumably also silicified) than the adjacent material is all that can be observed. These joints cut and displace the layer-parallel quartz veins of both the Waukaringa Lode type and the short strike parallel quartz pods which abound in this area.

One robust multi-element anomaly appeared from the first data set (1239595). Follow up results have only recently been received, which have shown a zone of anomalous gold associated with the Tindelpina shale member and further up the lower part of the Tapleys Hill Formation.

The geomorphic expression of the Tarcowie Siltstone was noted to change quite abruptly around the region from a strong ridge-former as at Waukaringa and Ajax Mines to a zone of no outcrop favoured as the drainage line as at the Eighteen Mile and Folly Dams. Examination of stream bottom exposures east of Folly Dam showed three zones of apparent argillic alteration within pyritic silts. The Utah map shows that these zones were not sampled, but as the Folly Dam area lies adjacent to the anticline of Apilla Tillite where Utah recorded

much of their gold anomalism and to catchment 1239595 with its multi-element signature, it is considered that further examination of this interval is warranted. Thin-sections cut from the argillic alteration zone which under the hand lens appeared to have the possibility of an acid tuff component, showed only calcification of altered siltstone.

S.P. SUGDEN / B. MURRELL

NATA CERTIFICATE

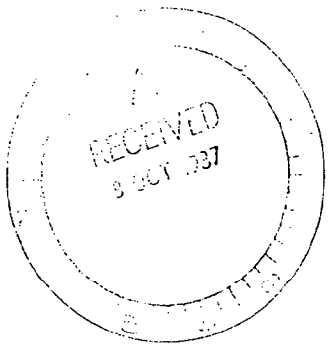
5 October 1987

Mr B Murrell
CRA Exploration Pty Ltd
PO Box 656
FYSHWICK ACT 2609



REPORT AC 765/88

YOUR REFERENCE:	DPO 46560
REPORT COMPRISING:	Cover sheet Page G1-G14 Page I1-I14
DATE RECEIVED:	9 September 1987
Approved Signatory:	Trevor Francis
Manager, Geo-Analytical Services	Don Patterson

for Dr William G. Spencer
General Manager
Applied Sciences Group

cc Mr W H Johnston
CRA Exploration Pty Ltd
31 Osmond Tce.
NORWOOD SA 5067

cc Chief Geologist Information Services
CRA Exploration Pty Ltd
PO Box 656
FYSHWICK ACT 2609

The report relates specifically to the sample tested and also the entire batch in so far as the sample is truly representative of the sample source.

CRA EXPLORATION PTY. LIMITED

FOURTH QUARTERLY REPORT FOR

HOPE BANK EL 1376, SOUTH AUSTRALIA,

FOR THE PERIOD ENDING 5TH JANUARY, 1988

AUTHORS: D.C. PALMER

DATE: 22ND DECEMBER, 1987

COPIES TO: CIS CANBERRA
SADME

SUBMITTED BY:

ACCEPTED BY:

CONTENTS

LIST OF PLANS

LIST OF TABLES

LIST OF FIGURES

LIST OF FIGURES (cont.)

LIST OF APPENDICES

1. SUMMARY

Final assay data values were received for stream sediment samples from four hundred and fifty two catchments throughout Hope Bank EL 1376.

Catchments anomalous in Au (97th Percentile) and Pb, Zn, Cu (95th Percentile) were delineated.

Anomalous Au values were returned from catchments draining the Elatina Sub-group, however, the majority were of low magnitude and aren't supported by multi-element signatures.

Weak Zn/Au anomalism is recorded from three catchments (1239668-1239670) draining the Farina Sub-Group, south of Waddington Bluff.

Weak Cu/Pb/Zn anomalism is also recorded from catchments (1449079, 1449084-1449086) draining an anticlinal closure of Apilla Tillite east of Hantken Hill.

Follow up soil sampling of these two multi-element anomalous catchments is recommended.

2. RECOMMENDATIONS

The following actions should be undertaken during the next phase of field work on EL 1376.

i. Soil sampling at 100 m spacing of the subdividing and marginal spurs of catchments east of Hantken Hill (Cu Pb Zn anomalism) and similarly catchments south of Waddington Bluff which recorded Au/Zn anomalism.

ii. Rock chip samples in these two regions should also be taken.

iii. Based on results from recommendations (i) and (ii), further detailed soil sampling on a grid pattern 25 m x 125 m, including catchment 1239595 (as previously recommended, Murrell/Sugden, 1987) should be undertaken to further delineate targets for costeaning.

3. INTRODUCTION

Hope Bank EL 1376 was granted to CRA Exploration Pty. Limited on the 6th January, 1987 for a period of one year.

The stream sediment geochemistry survey conducted within the licence area was designed to test all subcrop, regardless of stratigraphy and to use multi-element signatures to rate areas of anomalous gold in an attempt to locate a (stratabound Au) Telfer-style gold resource.

This report details the work carried out during the fourth quarter for EL 1376.

4. LOCATION

Hope Bank EL 1376 is located approximately 20 km north west of Yunta, on the Adelaide-Broken Hill Highway (plan no. SAa 4244). The licence covers an area of approximately 1303 sq km encompassing parts of East Wydown, McCoys Well, Melton, Minburra, Teetulpa and Wabricoola stations.

5. GEOLOGY

The major rock units found within the licence are the Adelaidean sediments of the Yudnamutana, Farina & Elatina Subgroups and Wilpena Group. Thin Quaternary sands, gravels and alluvium cover much of the above stratigraphy.

Table 1 describes the Adelaidean stratigraphy.

Hope Bank EL 1376 covers the eastern and western closures of the Waukaringa Syncline and a parallel antiform incorporating the same sequence to the south.

Mineralisation at Waukaringa and Ajax mines (which lie in the northern portion of the Waukaringa Syncline not held by CRAE) is associated with quartz and arsenical pyrite filling dilation zones in layer-parallel fault planes within the Farina Sub Group.

Material on dumps at the Waukaringa Mine contains superfine sulphide mineralisation in sandstones and siltstones, suggesting that the mineralisation in the quartz lodes occurs nearby to primary mineralisation in the sediments (Murrell, B. and Sugden, S., 1987).

Table 1

ADELAIDEAN STRATIGRAPHY - HOPE BANK EL 1376

Group	Unit	Lithology
Wilpena Gp	Pound Sst.	Quartzite feldspathic sandstone & siltstone
	Wonoka Fmn.	Calcareous siltstone & shale minor limestone & quartzites
	Ulupa siltstone	Siltstone (Brachina Equliv)
Elatina Sub Gp - Upper Glacial Gp		Diamictite & fluvials
Farina Sub Gp (intraglacials)	Undifferentiated	Shales, siltstone, carbonatic siltstones, minor carbonate units
	Tarcowie siltstone	Siltstone & sandstone
	Willochra Fmn.	Siltstone, shale, minor gritty sandstone & limestone
	Tapley Hill Fmn.	Siltstone, limestone, minor breccia bands, slump conglomerates & sandstone
Yunnamunta Sub Gp	Wilyerpa Qtzite	Sandstone, siltstone and minor tillites
	Apilla Tillite	Boulder tillite siltstone & sandstone
Callana Gp	Undifferentiated	

6. PREVIOUS WORK

Stream sediment samples from four hundred and fifty two sites were collected from sites representing a primary catchment in the size range 0.5 to 5.0 km^2 (plan SAa 4741).

The suspended clay fraction (-10 mm) from each of the stream sediment samples was analysed for the presence of gold to a detection limit of 0.0005 ppm whilst eight other elements were determined by AAS and a further ten by ICP. In addition, the first 181 samples were analysed for platinum and palladium by lead fire assay (DPO 46556).

A further 58 soil samples were collected at 100 m spacing in the axial zone of the Waukaringa Syncline crossing the mine-host stratigraphic sequence.

A multi-element signature with anomalous gold values from catchment 1239595, was followed up by collecting 37 soil samples at 100 m spacings up the spurs bounding the catchment (plan SAa 4742).

A detailed discussion of sampling procedures and concepts is given in the third quarterly report for EL 1376 (Murrell, B. and Sugden, S., 1987)

7. WORK CARRIED OUT

Work carried out during the fourth quarter comprised compilation of Pb, Zn, Cu and Au results above the threshhold positioned at the 95th Percentile of background population for each element.

Au revealed a distinct change in slope above the 95th Percentile which was interpreted to represent the boundary between background and anomalous samples. Table 2 lists anomalous Au, Cu, Pb, Zn and As values for each data set.

Due to clear differences in base line shifts (esp. Au) in the laboratory runs, each data set was examined individually, on a DPO basis.

Only assay values pertaining to the -10 um suspended clay fraction from drainage samples were evaluated. Furthermore, to reduce skewness in the data set high element values from the Ajax Mine (samples 1239756, 1239757, 1239759, 1239762) were not included in the 46557 DPO data set.

Cumulative frequency graphs for Au, Pb, Zn and Cu are displayed on figures 1-12.

TABLE 2

SUMMARY OF ANOMALOUS ELEMENT and VALUES BASED ON DPO

ELEMENT	DPO NO.	CURVE TYPE	ANOMALOUS VALUE >95TH PERCENTILE	NO. OF SAMPLES
Zn	46557	Normal Distribution	95 ppm	8
	46556	Normal Distribution	110 ppm	9
	46560	Normal Distribution	106 ppm	4
Cu	46556	+ve skewed	37 ppm (4)	3

8. RESULTS

A compilation of Au, Pb, Zn, Cu and As anomalism from each data set showing areas of elevated metal values appears on plan SAa 4853.

A summary of interpreted results is as follows:-

i. Catchments draining the Upper glacial unit (mapped as between Wabricoola Homestead and north of Waddington Bluff (Elatina Subgroup) reported anomalous gold values, the majority which are not supported by other base metals.

This gold is probably derived from fluvial concentrations, in reworked zones within the diamictite unit.

ii. Zn/Au anomalism is recorded from three catchments (1239668-1239670) draining the Farina Sub-Group Interglacials to the south of Waddington Bluff.

iii. Cu/Pb/Zn anomalism is recorded from catchments (1449079, 1449084-1449086) draining an area incorporating an anticlinal closure of Apilla Tillite , east of Hantken Hill.

Isolated Pb and Cu anomalism is also recorded from catchments adjacent to or draining from this stratigraphic unit throughout Hope Bank EL 1376.

iv. Isolated Zn anomalies exist from catchments draining Farina Subgroup glacials (Tapley Hill Formation Equivalents) in the north-eastern portion of EL 1376. This is the same sequence that appears to be the source of a multi-element signature at catchment 1239595, north of Folly Dam.

Dear Sir,

Re: HOPE BANK EL 1376

Quarterly Report For Period Ending 5th April, 1988

During the quarter, no field work was undertaken.

Expenditure for the period ended 31st March, 1988 was minimal and amounted to $3 087, consisting of:

Payroll	$ 935
Supplies	$ 356
Vehicle	$ 734
Rent	$ 245
Overheads	$ 817
	$3 087

Yours faithfully,

W.H. JOHNSTON
CHIEF GEOLOGIST S.A./N.T.

CONTENTS

LIST OF PLANS

LIST OF TABLES

LIST OF APPENDICES

1. SUMMARY

Catchments within Hope Bank EL 1376 which reported anomalous multi-element signatures were selected for follow up sampling.

Exposures of outcrop and float were sampled from within catchments 1239668-1239670, south of Waddington Bluff, and catchments 1449079, 1449084-1449086 east of Hantken Hill.

Follow up rock chip and float sampling returned low base metal and gold assays.

2. INTRODUCTION

Hope Bank EL 1376 was granted to CRA Exploration Pty. Limited on 6th January, 1987 for a period of one year. A subsequent extension for a one year period was granted on 6th January, 1988.

During 1987, a stream sediment geochemistry survey was conducted within the Hope Bank EL 1376 licence. The survey was designed to test all subcrop regardless of stratigraphy and to use multi-element signatures to rate areas of anomalous gold in an attempt to locate a Telfer-style (stratabound Au) resource.

This report describes the work carried out during the sixth quarter ending 5th July, 1988, and summarises all work completed by CRA Exploration Pty. Limited.

3. CONCLUSIONS

Exposures of outcrop sampled in catchments south of Waddington Bluff returned background metallic element values.

The source of the Cu/Pb/Zn stream sediment anomalism recorded in adjacent catchments east of Hantken Hill, appears to be a small lateritic ironstone accumulation overlying the Apilla Tillite.

Work programmes completed by CRA Exploration Pty. Limited within EL 1376 has downgraded the potential of the area to host significant stratabound gold mineralisation. No further work appears warranted within Hope Bank EL 1376.

4. LOCATION

Hope Bank EL 1376 is located approximately 20 km north west of the Yunta township, on the Adelaide-Broken Hill Highway (plan no. SAa 4244). The licence covers an area of approximately 1303 sq km encompassing parts of East Wydown, McCoys Well, Melton, Minburra, Teetulpa and Wabricoola stations.

5. PREVIOUS WORK

Work carried out on Hope Bank EL 1376 by CRA Exploration Pty. Limited, up to and including the sixth quarter is summarised in Table 1. A detailed discussion of sampling procedures and concepts is given in the third quarterly report for EL 1376 (Murrell, B. & Sugden, S.P., 1987).

Table 1

Year	Remarks	Specifications	Report
1987	Stream Sediment Sampling	452 Catchments, 0.5-5.0 km^2 in size	3rd Qtly Rpt Hope Bank EL 1376
1987	Geochemistry	452 samples assayed for Au (0.5 ppb) fire/AAS + 8 elements (ICP), 10 elements (AAS), first 181 samples Pt and Pd lead/fire AAS.	3rd Qtly Rpt Hope Bank EL 1376
1987	Soil sampling	37 samples from spurs bounding catchment 1239595.	
		56 samples of mine-host stratigraphic sequence in Waukaringa Syncline.	3rd Qtly Rpt Hope Bank EL 1376
1987	Rock Sampling	6 samples, miscellaneous locations	3rd Qtly Rpt Hope Bank EL 1376
1987	Geochemistry	93 soil samples assayed for Au + base metals	3rd Qtly Rpt Hope Bank EL 1376

Table 1 (cont.)

Year	Remarks	Specifications	Report
1987	Statistics	Compilation of anomalous Cu,Pb,Zn,As 95th Percentile, Au 97th Percentile. Delineation of catchments with multi-element signatures.	4th Qtly Rpt Hope Bank EL 1376
1988	Rock Chip Sampling	51 Rock samples from anomalous catchments	6th Qtly Rpt Hope Bank EL 1376
1988	Geochemistry	42 rock samples assayed for Au & base metals	6th Qtly Rpt Hope Bank EL 1376

6. GEOLOGY

The major rock units found within the licence are the essentially unmetamorphosed folded Adelaidean sediments of the Burra Group, Umberatana Group (Yudnamutana, Farina and Elatina Sub-Groups) and Wilpena Group. Outcrop of Tertiary rocks is limited to small areas of ferruginous laterite and silcreted sands. Thin Quaternary sands, calcreted gravels, alluvium and colluvium cover much of the Adelaidean stratigraphy.

Table 2 describes the Adelaidean stratigraphy within Hope Bank EL 1376.

Hope Bank EL 1376 covers the eastern and western closures of the Waukaringa Syncline and a parallel antiform incorporating the same sequence to the south. The mineralisation at Waukaringa and Ajax mines (which lie in that portion of the Waukaringa Syncline not held by CRAE) is associated with quartz and arsenical pyrite filling dilation zones in layer parallel fault planes. Superfine sulphide mineralisation occurs in the Farina Sub-Group sandstones and siltstones at Waukaringa Mine, suggesting that the mineralisation in the quartz lodes occurs nearby to primary mineralisation in the sediments (Murrell, B. & Sugden, S.P., 1987).

Table 2

ADELAIDEAN STRATIGRAPHY - HOPE BANK EL 1376

	Group/Sub Group	Unit	Lithology
	Wilpena Gp	Pound Sst.	Quartzite feldspathic sandstone & siltstone
		Wonoka Fmn.	Calcareous siltstone & shale minor limestone & quartzites
		Ulupa Siltstone	Siltstone (Brachina Equliv)
Umberatana Group	Elatina Sub Gp - Upper Glacial Gp		Diamictite & fluvials
	Farina Sub Gp (intraglacials)	Undifferentiated	Shales, siltstone, carbonatic siltstones, minor carbonate units
		Tarcowie Siltstone	Siltstone & sandstone
		Willochra Fmn.	Siltstone, shale, minor gritty sandstone & limestone
		Tapley Hill Fmn.	Siltstone, limestone, minor breccia bands, slump conglomerates & sandstone.
	Yudnamutana Sub Gp	Wilyerpa Qtzite	Sandstone, siltstone and minor tillites
		Appila Tillite	Boulder tillite siltstone & sandstone
	Burra Gp	Undifferentiated	

7. WORK CARRIED OUT

From the stream sediment sampling programme completed within Hope Bank EL 1376, catchments reporting 'anomalous' base metal and Au assay values were delineated for follow up sampling (plans SAa 4741, SAa 4742 & SAa 4853). A summary of interpreted results is detailed in CRAE Report No. 14946.

During the sixth quarter sampling of representative outcrop was completed in the following areas;

i. catchments 1239668-1239670, south of Waddington Bluff which reported weak Zn/Au 'anomalism', and

ii. catchments 1449079, 1449084-1449086, east of Hantken Hill which recorded Cu/Pb/Zn 'anomalism', in an area incorporating an anticlinal closure of Appila Tillite.

Fifty one rock chip and float samples were collected. Sample locations are plotted on plan SAa 4950.

Low base metal and Au assay values were returned from all rock chip samples. Anomalous Zn (470 ppm), Pb (1100 ppm) and elevated Cu (160 ppm) values were returned from a sample of lateritic ironstone float (sample no. 1164197), collected within catchment 1449085. A rock sample ledger appears in Appendix I.

8. DISCUSSION

The source of Cu/Pb/Zn stream sediment anomalism recorded in adjacent catchments, east of Hantken Hill, appears to be a small lateritic ironstone accumulation overlying the Appila Tillite (plan SAa 4950).

The limited areal extent of the lateritic ironstone and the low base metal and Au assays, returned from rock samples collected in catchments south of Waddington Bluff, has downgraded the potential of the area to host significant stratabound Au mineralisation.

No further work appears warranted within Hope Bank EL 1376.

D.C. PALMER

DCP/pq

EXPENDITURE

Expenditure for the period ended 30th June, 1988, the nearest accounting period amounted to $8 860, as listed below.

	$
Payroll	4 402
Supplies	260
Vehicle	1 569
Travel	231
Rent	327
Sundry	800
Overheads	1 271
Total	$8 860

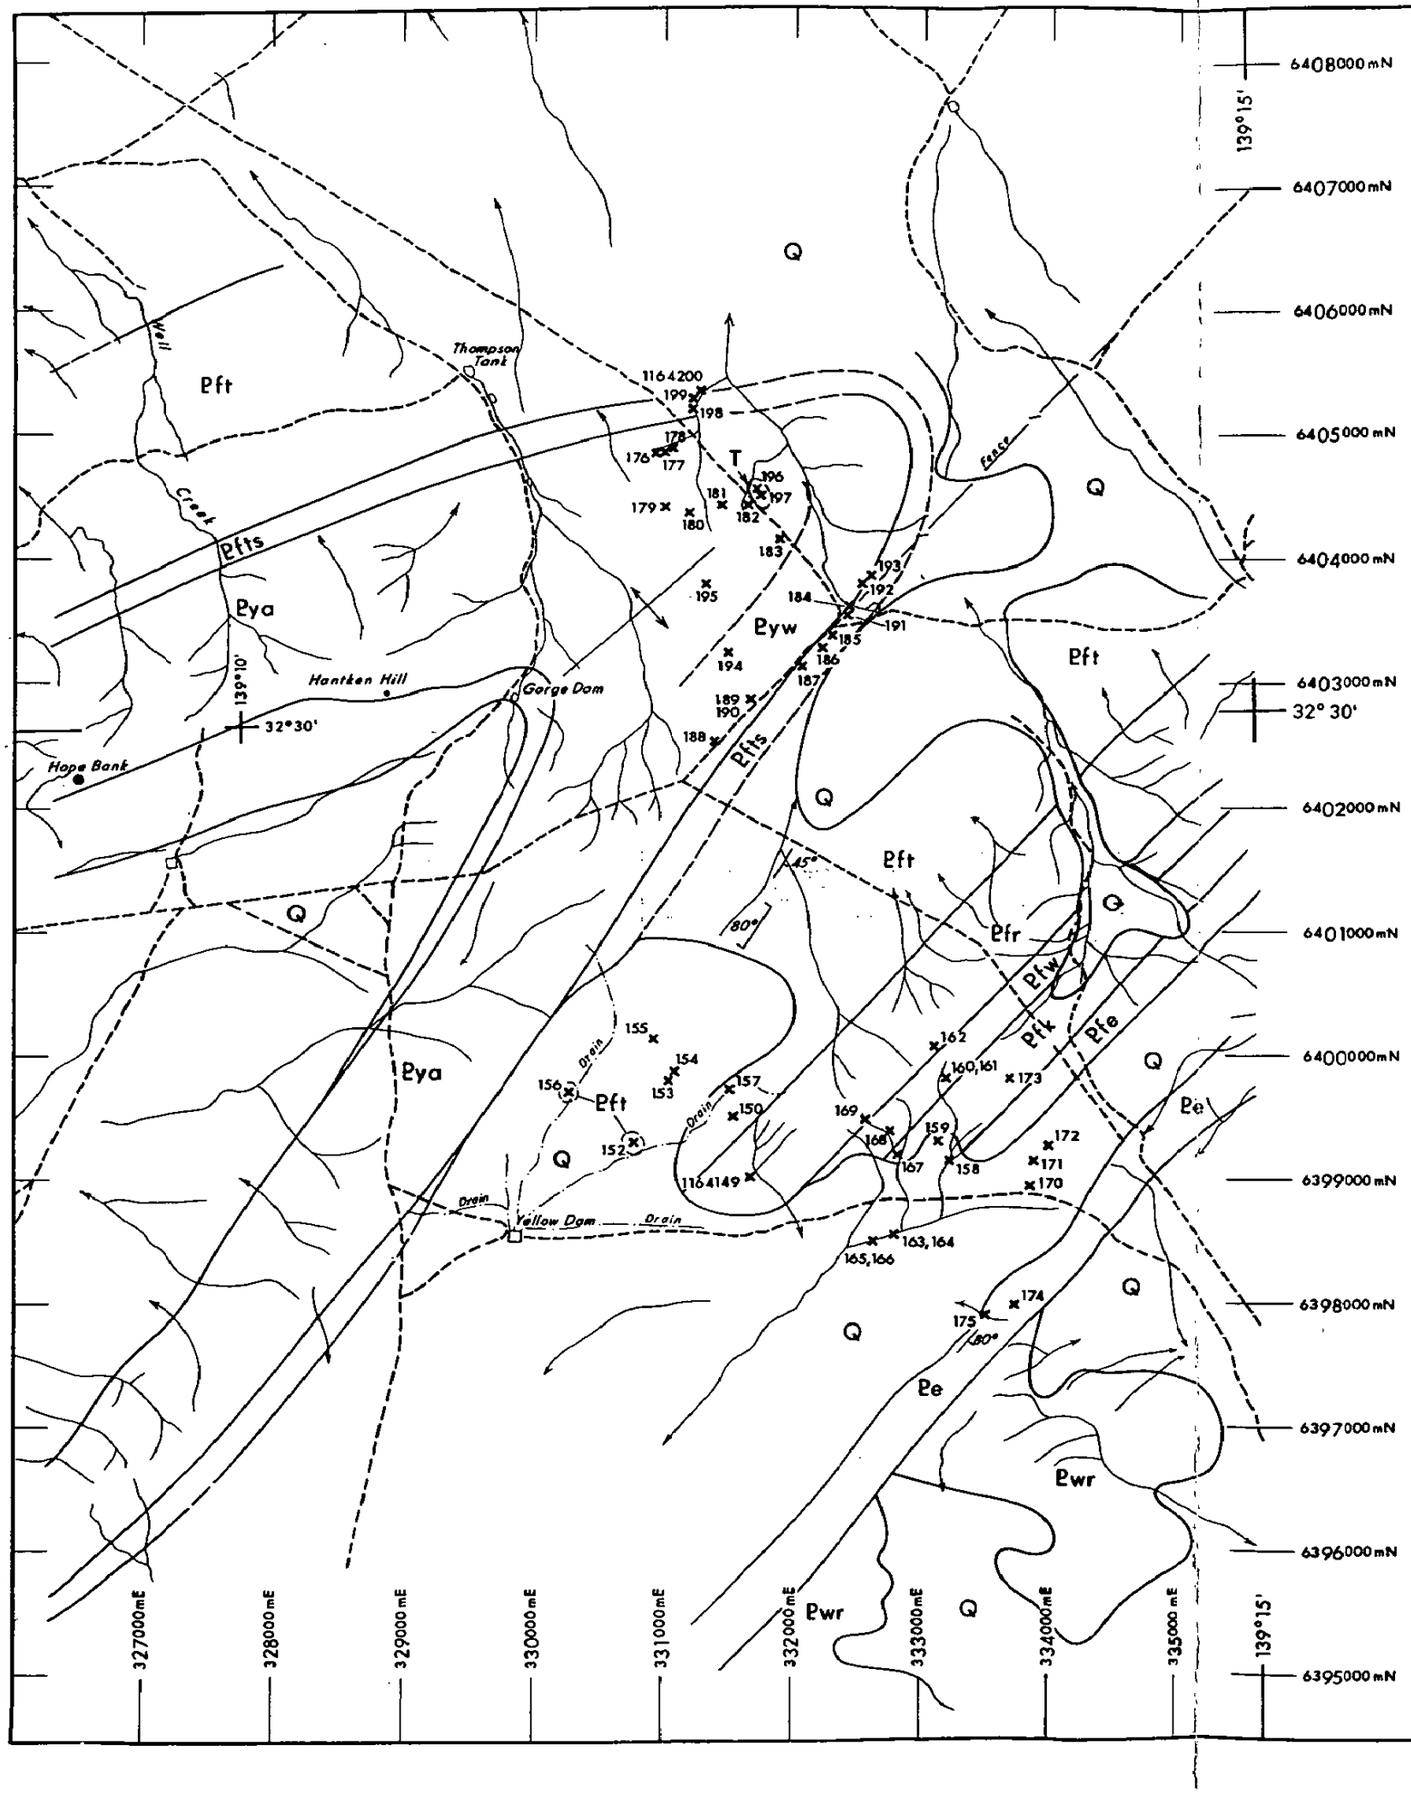
LOCATION PLAN

Approx. Area 1283 Km²

REF.	ORROROO SI 54-1, OLARY SI 54-2		
SCALE	1 : 250000		
AUTHOR	W.H.J.	REPORT	15334
DATE	July. '88	PLAN No	SAa 4244



LEGEND

QUATERNARY
- Q — Scree, alluvium and sand spreads.

TERTIARY
- T — Lateritic and Silcreted gravels.

PROTEROZOIC (ADELAIDEAN)

WILPENA GROUP
- Pwr — Ulupa Siltstone (Nuccaleena Fmn.)

UMBERATANA GROUP

Elatina Sub-Group
- Pe — Undifferentiated

Farina Sub-Group
- Pfe — Enorama Shale.
- Pfk — Waukaringa Siltstone.
- Pfw — Willochra Formation.
- Pfr — Tarcowie Siltstone.
- Pft / Pfts — Tapley Hill Formation. Tindelpina Shale Member.

Yudnamutana Sub-Group
- Pya / Pyw — Wilyerpa Quartzite. Appila Tillite.

Burra Group
- Pb — Undifferentiated

- Geological boundary
- Geological boundary approximate
- 45° Strike and Dip
- 80° Cleavage
- Anticline

0 1 2 3 4 5 Km.

Sample Numbers 1164149 – 150
1164152 – 200
